Proposal for amendments to Regulation No. [xxx] (the Moving Off Information System for the Detection of Pedestrians and Cyclists)

The text was reproduced below was prepared by the experts from the VRU-Proxi Informal Working Group (VRU-Proxi) to amend the new UN Regulation on uniform provisions concerning the approval of motor vehicles with regard to the Moving Off Information System for the Detection of Pedestrians and Cyclists. The modifications to the existing text of the draft Regulation (see GRSG-118-06) are marked in bold for new or strikethrough for deleted characters.

I. Proposal

Paragraph 5.2.2.3.3., amend to read:

“5.2.2.3.3. When performing a turning manoeuvre, the MOIS detection strategy may be adjusted. It is not required to adjust the sensors to the steering angle. The detection adjustment strategy shall be explained in the information referred to in paragraph 6.1. The Technical Service shall verify the operation of the system according to the strategy.”

Paragraph 5.5.1., amend to read:

“5.5. System initialisation

5.5.1. If the MOIS has not been initialised calibrated after a cumulative driving time of 15 seconds above a speed of 0 km/h (including stationary phases), information of this status shall be indicated to the driver. This information shall exist until the system has been successfully initialised calibrated.”

Paragraph 5.8.3., amend to read:

“5.8.3. The MOIS failure warning signal shall be activated with the activation of the vehicle master control switch. This requirement does not apply to collision failure warning signals shown in a common space to the failure warning signal.”

Appendix 1, amend to read:

Appendix 1

Figure 1
Set Up for Static Crossing Tests

Where the following definitions apply:

- $d_w$: vehicle width.
- $d_{25\%}$: a distance relating to 25% of the vehicle width.
- $d_{NSP}$: the distance from the nearside vehicle plane to the nearside separation plane, defined as 0.5 m.
- $d_{OSP}$: the distance from the offside vehicle plane to the offside separation plane, defined as 0.5 m.
- $d_{TC}$: the forward separation distance for each test case.
- $d_{FSP}$: the distance from the vehicle front to the maximum forward separation plane.
- $d_{LPI}$: the distance relating to the last point of information (LPI).

</tbody>
</table>

Where the following definitions apply:

- $d_{NSP}$: the distance from the nearside vehicle plane to the nearside separation plane, defined as 0.5 m.
- $d_{OSP}$: the distance from the offside vehicle plane to the offside separation plane, defined as 0.5 m.
- $d_{TC}$: the forward separation distance for each test case.
- $d_{FSP}$: the distance from the vehicle front to the maximum forward separation plane.
- $d_{LPI}$: the distance relating to the last point of information (LPI).
II. Justification

1. Justifications for paragraph 5.2.2.3.3.: MOIS focuses on straight driving situations. As the testing procedure is not defined, this part of the requirement may lead to too many testings.

2. Justifications for paragraph 5.5.1.: In VRU-Proxi#14, we agreed to use the word initialisation instead of calibration to be in line with the wording used in the AEB regulation. The MOIS (and the AEB) needs driving situations to initialise the system.

3. Justifications for paragraph 5.8.3.: 5.8 deals with failure warning signals.

4. Justifications for Appendix 1.: clarifications of the definitions listed for the table 1 and figure 1.
