Max and Min Femur  
Certification Analysis Flex PLI

IG GTR9-PH2 9<sup>th</sup> Meeting

# Introduction

- ▶ In order to control and monitor femur performance it was requested by the Informal Group to review max and min femur corridors for input into the manual for inverse and pendulum dynamic certification.
- ▶ This is in addition to the femur zero crossover timing corridors proposed
- ▶ These corridors when established should help inform users that the femur is functioning correctly and to take steps to correct if not.

# Data Requirement & Corridor Margin

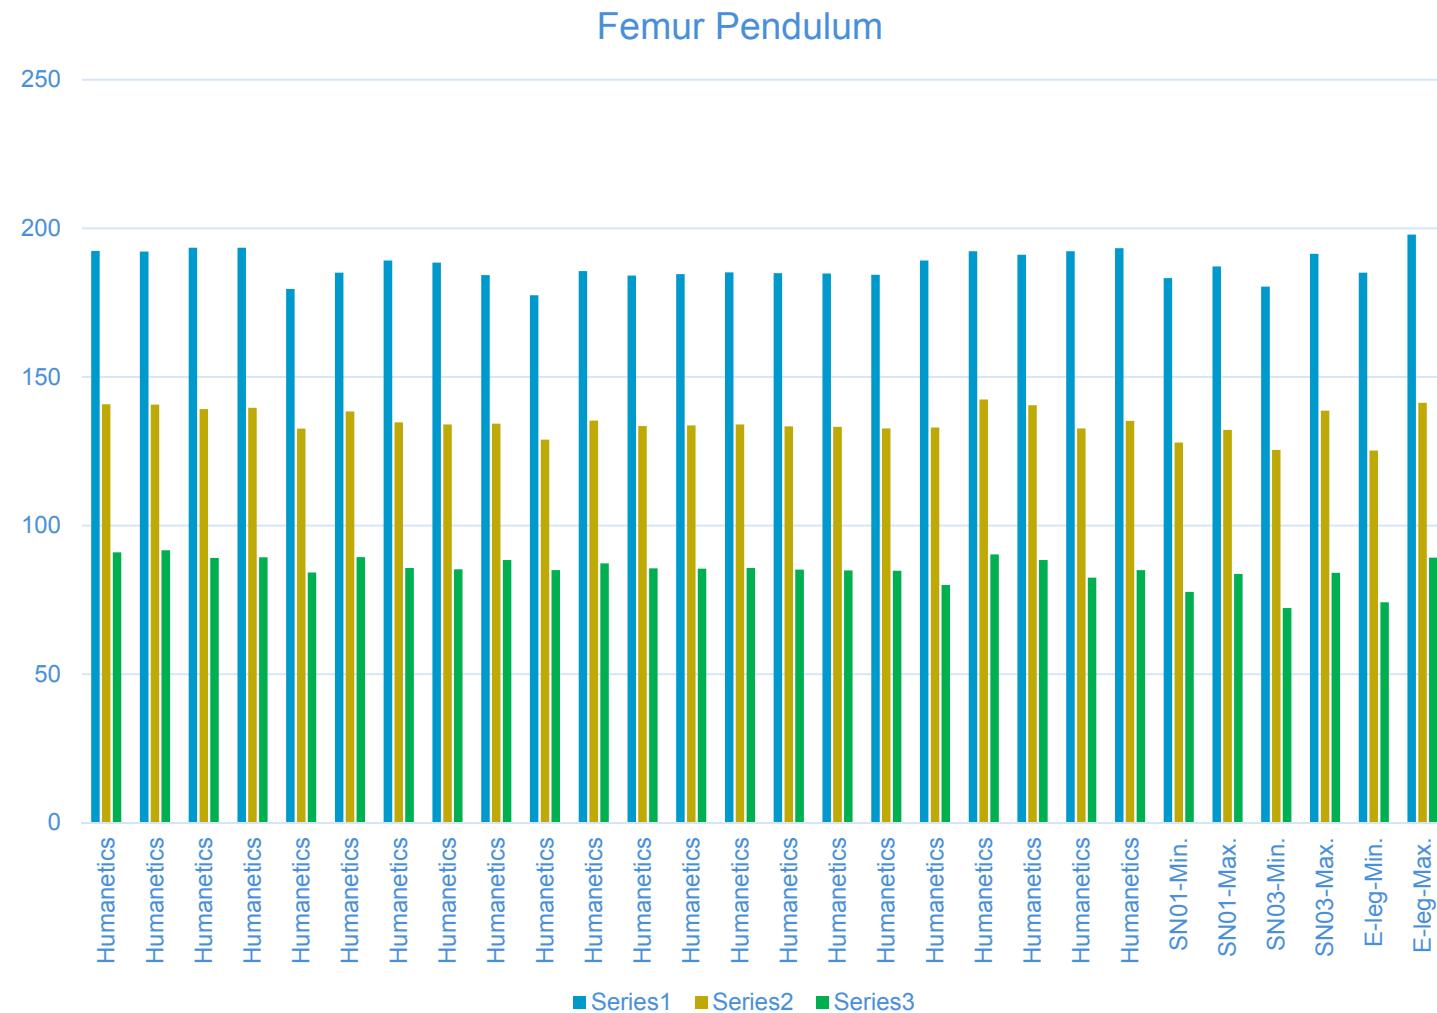

- ▶ Legs must be to master leg specification
- ▶ Legs must be passing all regulation corridors
- ▶  $\pm 5\%$  has been considered to the max and min result as a margin for assessment

# Femur Results Pendulum

# Femur Moments Inverse Graphic

# Summary

- ▶ The pendulum results show a spread of max and min values and the range is relatively narrow
- ▶ The inverse results show all the max and min values on a single leg. The range is wider than the pendulum.
- ▶ Humanetics require more results from other labs to finalize these corridors before adding to the manual.
- ▶ This would then follow the process used for data gathering on setting the regulated corridors using different labs and before users reject legs due to corridors not being met despite meeting the regulated channels

# Random Inverse Femur Zero Crossing Timing Check

Graph polarity is shown reversed  
Timing for Femur channels above 40 to 43 ms  
Inside corridor of 28 to 58

# Thank You
