China Proposal for Micro-van and Micro-truck

Micro-van and Micro-truck:
- GVM ≤ 2.5 ton
- R-point height ≥800mm from the ground
- Mid-engine and with Rear axle drive

China’s proposal is already included in the document “ECE-TRANS-WP29-GRB-59-inf4r1e - IWG Changes 2014-02-20a” Paragraph 6.2.2.1.6. highlighted in red.
What are Micro-Vans and Micro-Trucks?

GVM ≤ 2.5 ton
R-point height ≥800mm from the ground
Mid-engine and with Rear axle drive

M1 vehicle

- SEDAN (front engine)
- SUV (front engine)
- MPV (front engine)
- Heavy M1 (GVM > 2.5t)

Micro-van (MR)

NI vehicle

- Van (FF)
- Pick up (FR)
- Light truck (GVM > 2.5t)
- Micro-truck (MR)

GVM ≤ 2.5 ton
R-point height ≥800mm
Mid-engine and with Rear axle drive

In the February 2012, during the 55th session, China pointed out that the heavy M1 with GVM > 2.5t is very difficult to fulfill the 72 dB(A) limit value, and a limit value **Paragraph 6.2.2.1.1.** for this sub-category is nearly made certain.

During the 55th session, China also pointed out that the Micro-Van and Micro-Truck with GVWs ≤ 2.5t is very difficult to fulfill the 72 dB(A) limit value, and **Paragraph 6.2.2.1.6.** is drafted during the 59th session of GRB for this sub category. And we hope this Paragraph 6.2.2.1.6. can be kept.

---

“ECE-TRANS-WP29-GRB-59-inf4r1e - IWG Changes 2014-02-20a”

6.2.2.1.6. For vehicle types of category M1 and N1 having a maximum technically permissible laden mass of less than or equal to 2.5 tons and a R-point height greater than 800mm from the ground and a mid engine and with rear axle drive, the limits of the vehicle types of category N1 having a maximum technically permissible laden mass above 2.5 tons apply.
Market share of Micro-Van and Mirco-Truck in China

Total sales of micro-vehicles 2,152,234 units in 2013, 11% M1 and N1, of which Micro-Van 8% and Micro-Trucks 3%

**COMBINED M1/N1 SALES**

- General Passenger Cars 82%
- Sedan
- MPV
- SUV
- Micro-Vans 8%
- Light Bus 2%
- Micro-Trucks 3%
- Other Trucks 5%
- FR Truck
- Medium Truck
Micro-Van and Micro-Truck usage in China

By locations

**MICRO-VAN**
- Village to town, 8%
- Village to village, 40%
- Countryside/villages/farms, 52%

**MICRO-TRUCK**
- Village to town, 34%
- Countryside/villages/farms, 66%

By usage

**MICRO-VAN**
- Farm, 3%
- Construction, 26%
- Delivery, 44%

**MICRO-TRUCK**
- Farm, 28%
- Logistics, 18%
- Delivery, 54%
Structure differences between micro-vehicles and front engine type

Front Engine type
GVM ≤ 2.5t

Different type

Same type

GVM ≤ 2.5 ton
R-point ≥ 800mm from the ground
Mid-engine and with rear axle drive
The majority of noise sources in Micro-Van and Micro-Truck are directly exposed, resulting in inherently louder noise.
Powertrain system differences between micro-vehicles and front engine type

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

*Always higher transmission ratio and always weaker power engine with PMR(GVM) 20 – 41kW/t.

12-13 inches tyre, and the tyre radius is between 250-280mm.

* A higher transmission ratio and lower tyre radius make the test engine speed of Micro-Van and Micro-Truck higher than front engine type, resulting in louder noise.
Micro-Van and Micro-Truck perform differently than front engine type

<table>
<thead>

</tr>
</tbody>
</table>

- Average value of micro-vehicles: 73.1 dB(A), which is nearly 2 -3dB(A) higher than ordinary passenger cars.
- The micro-vehicles engine speed during the test are always higher than 65% of rated engine speed, but the ordinary passenger cars engine speed during the test are always lower than 50% of rated engine speed.
Structure and Powertrain differences lead to different noise contributions

Vehicle External Noise Contribution from Each Sound Source in R51-03 Sound Emission Test

Overall level 72 – 74 dB(A)

- Power train, 42.10%
- Air intake; 18.70%
- Exhaust; 16.80%
- Tire; 14.80%
- Others; 7.60%

Micro-Van and Micro-Truck
Difficulty of noise reduction for Micro-Van and Micro-Truck

* There is no engine-compartment, and it’s impossible to cover the whole powertrain system for the purpose of reducing noise.

* Addition of Noise shields will greatly reduce ground clearance & thermal performance, key characteristics for Micro-Van and Micro-Truck used in mountain and rural areas.

The ground clearance is only 140-155mm, adding noise shields will reduce ground clearance by 10mm, resulting in poor passing capacity.

The thermal performance of Micro-Van and Micro-truck is not as good as front type, with the noise shield the thermal performance will be worse.
Micro-Van and Micro-Truck are typically 2 to 3 dBs higher than front engine type.

- Micro-vans & micro-trucks need the 74 dB(A) limit value similar to heavy M1 vehicles for R51 / 03 series.

</table>
Chinese micro-vehicles are not designed or planned for sales in Europe, Japan or US.

- The requirements of ECE, FMVSS and EPA regulations (R13H, R127, R94, FMVSS 208, EPA Tier II, etc.) are too difficult for Micro-Van and Micro-Truck.
Overseas market of Micro-Van and Micro-Truck (2013)

* 120,000 Micro-Vans and Micro-trucks were sold overseas, nearly all of them were sold to Africa, South America and the developing area of Asia (not including Japan or South Korea).
* Although this kind of vehicle is very cheap and poor performance, and will not be accepted by the customers in Europe, Japan, or US. But it’s really an important vehicle type for developing areas and developing countries.
Conclusion

- The structure and powertrain system of Micro-Vans and Micro-Trucks are quite different from the front-engine type vehicles, which will lead to a 2-3dB(A) higher test results according to ECE R51 / 03.
- Micro-Vans and Micro-Trucks need a 74dB(A) limit value for phase 1st with a cut-off nearly 15%.
- China suggests keeping “GRB 59-04 6.2.2.1.6. For vehicle types of category M1 and N1 having a maximum technically permissible laden mass of less than or equal to 2.5 tons and a R-point height greater than 800mm from the ground and a mid engine and with rear axle drive, the limits of the vehicle types of category N1 having a maximum technically permissible laden mass above 2.5 tons apply.”
