Subject: AW: Question on determining the power of EVs

The power determination of EV's (PEV and HEV) was an issue that wasn't mentioned in the reference guide. But there is a regulation already existing (UN R 85) including some specific requirements. And the issue was raised during WLTP development, because power is a criteria for classification. For gtr no. 15 an interim solution was found for the classification of EV's, because the power determination based on UN R 85 was considered as not suitable. This is still an open issue for WLTP subgroup EV.

So it's obvious that we need to develop a measurement procedure and a regulation. My position is, not to regulate the power determination (measurement procedure) of EV's in gtr no. 15, but to amend UN R 85 and/or to develop a new gtr.

I made no clear proposal, which group should develop such a proposal for a regulation. I think there are 3 principle options:

- to extend the mandate of WLTP (iwg or EV-subgroup) - development of a new gtr
- to include it in the EVE mandate (iwg or new EVE subgroup) - development of a new gtr
- to create a new iwg with a new mandate - amendment of UN R 85 and/or development of a new gtr

This needs to be considered by interested parties over the next months.

Best Regards
Christoph
