## Consolidated working draft text for the ADS GTR and UN Regulation

The following table provides current draft provisions in the first column, proposals for revision and comments for consideration in the middle column, and the right column for noting discussion and/or outcomes during the session. Rows highlighted in yellow indicate proposals for amendments, questions or comments for discussion, and other matters requiring IWG attention and decision. Rows highlighted in blue and purple indicate major sections for ease in navigating the document. Links are provided for ease in navigating between related provisions.

| Current Tex    | xt   | Proposals and comments  | Session discussion and outcomes |
|----------------|--|---|---------------------------------|
|                | Title  |   |                                 |
| [GTR]<br>[UNR] | Safety of Automated Driving Systems<br>Uniform provisions concerning the<br>approval of vehicles with regard to<br>Automated Driving Systems   |   |                                 |
| 1.             | Purpose  |   |                                 |
| 1.1.           | This Global Technical Regulation<br>(GTR) provides worldwide harmonised<br>procedures to set and verify compliance<br>with minimum requirements for the<br>safety of Automated Driving Systems<br>(ADS) and vehicles equipped with<br>ADS. |   |                                 |
| 1.1.           | This Regulation establishes uniform<br>provisions concerning the approval of<br>motor vehicles with regard to<br>Automated Driving Systems (ADS).  | (Secy) May this be deleted? It is redundant to the title and scope. |                                 |
| 2.             | Scope  |   |                                 |
| 2.1.           | This GTR applies to the ADS of vehicles of categories 1 and 2.   | Open item: Discussion point from ADS-03.                            |                                 |
| 2.1            | This Regulation applies to the approval of vehicles of categories M and N with   |   |                                 |

| Current Text                                     | Proposals and comments | Session discussion and outcomes |
|--|------------------------|---------------------------------|
| regard to their Automated Driving<br>System (ADS |                        |                                 |

| 3.   | Definitions  |   |  |
|------|--|---|--|
| 3.1. | <i>"Abstraction"</i> means a process of selecting relevant aspects of a source or referent system to be represented in a model or simulation. <sup>1</sup>   |   |  |
| 3.2. | <i>"Automated Driving System (ADS)"</i><br>means the vehicle hardware and<br>software that are collectively capable of<br>performing the entire Dynamic Driving<br>Task (DDT) on a sustained basis. <sup>2</sup> |   |  |
| 3.3. | <i>"ADS feature"</i> means an application of<br>an ADS designed specifically for use<br>within an Operational Design Domain<br>(ODD).  | ADS-03: Is this definition consistent with the way "feature" is used across the provisions? |  |
| 3.4  | <i>"(ADS) function"</i> means an ADS hardware and software capability designed to perform a specific portion of the DDT.   |   |  |
| 3.5. | <i>"ADS vehicle"</i> means a vehicle equipped with an ADS.   |   |  |
| 3.6. | <i>"Behavioural competency"</i> means an expected and verifiable capability of an ADS feature to operate a vehicle within the ODD of the feature.  |   |  |

<sup>&</sup>lt;sup>1</sup> Any modelling abstraction carries with it the assumption that it should not significantly affect the intended uses of the simulation tool.

<sup>&</sup>lt;sup>2</sup> This definition is based on SAE J3016 and ISO/PAS 22736 (Taxonomy and Definitions for Terms Related to Driving Automation Systems for On-Road Motor Vehicles). These standards define levels of driving automation based on the functionality of the driving automation system feature as determined by an allocation of roles in DDT and DDT fallback performance between that feature and the (human) user (if any). The term "Automated Driving System" is used specifically to describe a Level 3, 4, or 5 driving automation system.

| 3.7.    | <i>"Closed-loop testing"</i> means testing in<br>an environment in which actions of the<br>ADS hardware, software, or other<br>element(s) in the loop influence the<br>actions of other objects in the<br>simulation. <sup>3</sup>   |  |
|---------|--|--|
| 3.8.    | <i>"Open-loop testing"</i> means testing in<br>an environment in which the actions of<br>the ADS hardware, software, or other<br>element(s) in the loop do not affect the<br>actions of other objects in the<br>simulation. <sup>4</sup>   |  |
| 3.10.   | <i>"Driver"</i> means a human user who<br>performs in real time part or all of the<br>DDT and/or DDT fallback for a<br>particular vehicle.   |  |
| 3.11.   | <i>"Dynamic Driving Task (DDT)"</i> means<br>the real-time operational and tactical<br>functions required to operate the<br>vehicle.   |  |
| 3.11.1. | When the ADS is in operation, the<br>DDT is always performed in its entirety<br>by the ADS which means the whole of<br>the tactical and operational functions<br>necessary to operate the vehicle (i.e.,<br>the ADS performs "the entire DDT" as<br>stated in the definition of an<br>"Automated Driving System" under<br>para. 3.2.). These functions can be<br>grouped into three interdependent<br>categories: sensing and perception,<br>planning and decision, and control. |  |

For example, evaluating ADS interactions with other objects that respond to the actions of the ADS within a traffic model.
 For example, evaluating ADS interaction with a recorded traffic situation.

| 3.11.2. | Sensing and perception include:  |  |
|---------|--|--|
| 5.11.2. | • • •  |  |
|         | (a) Monitoring the driving environment                                 |  |
|         | via object and event detection, recognition, and classification.       |  |
|         |  |  |
|         | (b) Perceiving other vehicles and road                                 |  |
|         | users, the roadway and its fixtures, objects in the vehicle's driving  |  |
|         | environment and relevant   |  |
|         | environmental conditions.  |  |
|         | (c) Sensing the ODD boundaries, if                                     |  |
|         | any, of the ADS feature.   |  |
|         | (d) Positional awareness.  |  |
|         | ( )  |  |
| 3.11.3. | Planning and decision include:   |  |
|         | (a) Predicting actions of other road                                   |  |
|         | users.   |  |
|         | (b) Response preparation.  |  |
|         | (c) Manoeuvre planning.  |  |
| 3.11.4. | Control includes:  |  |
|         | (a) Object and event response  |  |
|         | execution.   |  |
|         | (b) Lateral vehicle motion control.                                    |  |
|         | (c) Longitudinal vehicle motion control.                               |  |
|         | (d) Enhancing conspicuity via lighting                                 |  |
|         | and signalling.  |  |
| 3.11.5. | The DDT excludes strategic functions.                                  |  |
| 3.12.   | "Strategic function" means a capability                                |  |
|         | to issue commands, instructions, or                                    |  |
| 2.12    | guidance for execution by an ADS. <sup>5</sup>                         |  |
| 3.13.   | <i>"Tactical function"</i> means a capability                          |  |
|         | to perceive the vehicle environment<br>and control real-time planning, |  |
|         | and control real-time planning,  |  |

<sup>&</sup>lt;sup>5</sup> Examples include setting the starting point, destination, route, and way points to be used by an ADS during a trip.

| 3.14.   | decision, and execution of manoeuvres,<br>including conspicuity of the vehicle<br>and its motion. <sup>6</sup><br><i>"Operational function"</i> means a<br>capability to control the real-time<br>motion of the vehicle. <sup>7</sup>                                      |  |
|---------|--|--|
| 3.15.   | <i>"Edge Case"</i> means a low-probability<br>occurrence that might arise within the<br>ODD of an ADS and that warrants<br>specific design attention due to the<br>potential severity of outcomes that<br>might result from encountering such a<br>situation or condition. |  |
| 3.16.   | <i>"ADS fallback response"</i> means a system-initiated deactivation of the ADS or an ADS-controlled procedure to place the vehicle in a minimal risk condition.   |  |
| 3.17.   | <i>"Fallback user"</i> means a user<br>designated to perform the DDT<br>pursuant to an ADS fallback response.  |  |
| 3.18.   | <i>"Minimal Risk Condition (MRC)"</i><br>means a stable and stopped state of the<br>vehicle that reduces the risk of a crash.  |  |
| 3.19.   | <i>"Model"</i> means a description or representation of a system, entity, phenomenon, or process.  |  |
| 3.19.1. | <i>"Stochastic model"</i> means a model<br>involving or containing a random<br>variable or variables pertaining to<br>chance or probability.   |  |

<sup>&</sup>lt;sup>6</sup> Examples include deciding whether to overtake a vehicle or change lanes, signalling intended manoeuvres, deciding when to initiate the manoeuvre, choosing the proper speed, and executing the manoeuvre.

<sup>&</sup>lt;sup>7</sup> Operational functions involve executing micro-changes in steering, braking, and accelerating to maintain lane position or proper vehicle separation and immediate responsive actions to avoid crashes in critical driving situations.

| 3.20.   | <i>"Model calibration</i> " means a process<br>of adjusting numerical or modelling<br>parameters in a model to improve<br>agreement with a referent.                                      |  |  |
|---------|---|--|--|
| 3.21.   | <i>"Model parameter"</i> means a numerical value inferred from real-world data and used to represent a system characteristic.   |  |  |
| New     |   | (OPI)<br><i>"Event"</i> means any situation happening in a given time and location.  |  |
| New     |   | (OPI)<br><i>"Safety-relevant event"</i> means an event which is<br>relevant for the evaluation of the safe operation of<br>the ADS Vehicle. These events also include<br>normal operation which are relevant to argument<br>specific ADS design choices and/or the safety<br>case. (e.g., fallback user unavailability, MRM) |  |
| 3.22.   | <i>"Occurrence"</i> means a safety-relevant event involving an ADS vehicle.   | (OPI)<br>"Occurrence" means a safety-relevant event<br>during which at least one of the following criteria<br>is fulfilled:  |  |
|         |   | a) Collision involving the ADS vehicle   |  |
|         |   | b) ADS vehicle system/component failure  |  |
|         |   | c) ADS vehicle produces a noncompliance with respect to the requirements of this regulation.   |  |
| 3.22.1. | "Non-critical Occurrence" means all<br>occurrences which are not "Critical<br>Occurrences" an operational<br>interruption, defect, fault, or other<br>circumstance that influenced or may | (OPI)<br>"Non-critical Occurrence" means occurrences<br>which are not "Critical Occurrences".  |  |

|         | have influenced ADS safety but did not<br>result in a collision or serious incident. <sup>8</sup>  |  |  |
|---------|--|--|--|
| 3.22.2. | "Critical Occurrence" means an<br>occurrence during which at least one of<br>the following criteria is fulfilled:  | (OPI)<br>"Critical Occurrence" means an occurrence<br>during which at least one of the following criteria<br>is fulfilled:   |  |
|         | (a) At least one person suffers an injury<br>that requires medical attention or<br>dies as a result of being in the<br>vehicle or being involved in the<br>occurrence. | <ul> <li>(OPI)</li> <li>(a) at least one person suffers an injury that requires medical attention or dies as a result of being in the vehicle or being involved in the event.</li> </ul>   |  |
|         | (b) The ADS vehicle, other vehicles or<br>stationary objects sustain physical<br>damage that exceeds a certain<br>threshold.   | <ul> <li>(OPI)</li> <li>(b) the ADS vehicle, other vehicles or stationary objects sustain physical damage that exceeds a certain threshold.</li> </ul>   |  |
|         | (c) any vehicle involved in the event<br>experiences an airbag deployment.   | <ul> <li>(OPI)</li> <li>(c) any vehicle involved in the event<br/>experiences a deployment of any non-<br/>reversible restraint system.</li> <li>Open item: Feasibility-How would manufacturer<br/>know that airbag deployed in other vehicle(s)?</li> </ul> |  |

<sup>&</sup>lt;sup>8</sup> Examples include minor incidents, safety degradation not preventing normal operation, emergency/complex manoeuvres to prevent a collision, and more generally all occurrences relevant to the safety performance of the in-service ADS (like transfer of control, interaction with remote operator, etc.).

| 3.23. | "Operational Design Domain (ODD)"<br>means the operating conditions under<br>which an ADS feature is specifically<br>designed to function.  |  |  |
|-------|---|--|--|
| 3.24. | "ODD exit" means:   |  |  |
|       | <ul> <li>(a) the presence of one or more ODD<br/>conditions outside the limits<br/>defined for use of the ADS feature,<br/>and/or</li> </ul>  |  |  |
|       | (b) the absence of one or more<br>conditions required to fulfil the<br>ODD conditions of the ADS<br>feature. <sup>9</sup>   |  |  |
| 3.25. | <i>"Other road user (ORU)"</i> means any entity making use of publicly accessible road infrastructure.  |  |  |
| 3.26. | <i>"Priority vehicle"</i> means a vehicle<br><b>operated while making use of</b> subject<br>to exemptions, authorizations, and/or<br>right-of-way under traffic laws while<br>performing a specified function.  | ADS-03 decision to continue review. Issues<br>raised concerned diversity of special-purpose<br>vehicles, signals used (or not), and levels of<br>privileges. Main aim to provide requirement to<br>respond appropriately to these kinds of vehicles. |  |
| 3.27. | <i>"Proving ground"</i> and <i>"Test track"</i><br>mean a facility closed to public traffic<br>and designed to enable physical<br>assessment of an ADS and/or ADS<br>vehicle performance, e.g., via sensor<br>stimulation and/or the use of dummy<br>devices. |  |  |

<sup>&</sup>lt;sup>9</sup> ODD conditions are distinct from ADS capabilities. An ADS may be designed to manage transient changes in the operating environment where such transient changes do not represent an ODD exit.

| 3.28. | <i>"Real time"</i> means the actual time during which a process or event occurs.   |   |  |
|-------|--|---|--|
| 3.29. | "Road-safety agent" means a <b>non-<br/>motorised</b> human being engaged in<br>directing traffic, enforcing traffic laws,<br>maintaining/constructing roadways,<br>and/or responding to traffic incidents.  | <ul><li>ADS-03 requested the drafting secretary to review the guidelines and draft requirements with regard to "road-safety agent".</li><li>(Secy) The term is not used in the guidelines or the current draft requirements.</li><li>Open issue: Delete or retain term? If retained, we need a proposal for a provision using the term.</li></ul> |  |
| 3.30. | <i>"Safety case"</i> means a structured<br>argument supported by a body of<br>evidence that provides a compelling,<br>comprehensible, and valid case that the<br>ADS is or will be free from<br>unreasonable risk for a given<br>application in a given environment.   |   |  |
| 3.31. | <i>"Safety concept"</i> means a description<br>of the measures designed into the ADS<br>so that it operates in such a way that it<br>is free of unreasonable safety risks to<br>the ADS vehicle user(s) and other road<br>users in every operating condition<br>relevant to the ODD.   |   |  |
| 3.32. | <ul> <li><i>"Safety Management System (SMS)"</i> means a systematic approach to managing safety, which encompasses and integrates organizational, human and technical factors:</li> <li>(a) Human component ensuring the ADS lifecycle is monitored by personnel with appropriate skills, training, and understanding to identify risks and appropriate mitigation measures to identify</li> </ul> | ADS-03 agreed to pull from the <u>requirements</u> section.   |  |

|       | <ul> <li>risks and appropriate mitigation<br/>measures while accounting for the<br/>possibility of human errors.</li> <li>(b) Organisational component<br/>procedures and methods that help to<br/>manage the identified risks,<br/>understand their relationships and<br/>interactions with other risks and<br/>mitigation measures, and help to<br/>ensure that there are no unforeseen<br/>consequences.</li> <li>(c) Technical component using<br/>appropriate tools and equipment.</li> </ul> |  |  |
|-------|--|--|--|
| 3.33. | <i>"Sensor Stimulation"</i> means a technique whereby artificially generated signals are provided to trigger the element under testing in order to produce the result required for evaluation of the element.  |  |  |
| 3.34. | <i>"Simulation"</i> means the imitation of<br>the operation of a real-world process or<br>system over time.  | <i>"Simulation"</i> means the imitation of the operation of a real-world process or system over time utilizing a software implementation for some (or all) of the models, tools or test environment.   |  |
| 3.35. | <i>"Simulation toolchain"</i> means a combination of simulation tools that are used to support the validation of an ADS.   | <i>"Simulation toolchain"</i> means a simulation tool<br>or a combination of simulation tools that are used<br>to support the validation of the ADS safety case<br>and/or of one or more performance/ functional/<br>user regulatory requirements. |  |
| 3.36. | <i>"Test case specification"</i> means the detailed specifications of what must be done by the tester to prepare for the test.   |  |  |
| 3.37. | <i>"Test method"</i> means a structured approach to consistently derive  |  |  |

|         | knowledge about the performance of an ADS by means of executing tests. <sup>10</sup>  |  |  |
|---------|---|--|--|
| 3.38.   | <i>"Traffic scenario"</i> means a description of a sequence of driving situations that may occur during a given trip. <sup>11</sup>   | (Concreliseus) The term "accretis" is used more  |  |
| 3.38.1. | <i>"Nominal scenario"</i> means a traffic<br>scenario representing usual and/or<br><b>expectable</b> expected objects, object<br>behaviours and/or road conditions.                                     | (General issue) The term "scenario" is used more<br>than 500 times in the guidelines. Current<br>definitions use subjective wording. ADS-03<br>deferred discussion of scenarios for a later<br>session. In principle, the classification of<br>scenarios as "nominal", "critical", or "failures"<br>needs to be objective.<br>Issue has been raised by the "Definitions" and<br>"DDT" OPI. See ADS-04-04, item 6 for DDT<br>OPI comments.<br><u>See comments</u> under "nominal" DDT<br>requirements for Definitions OPI comments. |  |
| 3.38.2. | <i>"Critical scenario"</i> means a traffic<br>scenario representing unusual and/or<br><b>unexpectable</b> <del>unexpected</del> objects,<br>object behaviours, and/or road<br>conditions.               |  |  |
| 3.38.3. | <i>"Failure scenario"</i> means a traffic scenario representing a system failure that compromises the capability of the ADS to perform the entire DDT.  |  |  |
| 3.38.4. | <i>"Functional scenario"</i> means a basic traffic scenario describing a situation and its corresponding elements at the highest level of abstraction in natural, non-technical language. <sup>12</sup> |  |  |
| 3.38.5. | <i>"Abstract scenario"</i> means a formalized, declarative description of a scenario derived from a functional  |  |  |

<sup>&</sup>lt;sup>10</sup> For example, virtual testing in simulated environments, physical, structured testing in controlled test-facility environments, and real-world on-road conditions.

<sup>&</sup>lt;sup>11</sup> Scenarios include a driving manoeuvre or sequence of driving manoeuvres. Scenarios can also involve a wide range of elements, such as some or all portions of the DDT, different roadway layouts, different types of road users and objects exhibiting static or diverse dynamic behaviours, and diverse environmental conditions (among many other factors).

<sup>&</sup>lt;sup>12</sup> For example, a description of the ego vehicle's actions, the interactions of the ego vehicle with other road users and objects, and other elements that compose the scenario such as environmental conditions.

|         | scenario. <sup>13</sup> The specification on the abstract level enables highlighting of the relevant aspects of the scenario while focusing on efficient description of relations (cause-effect).  |   |  |
|---------|--|---|--|
| 3.38.6. | <i>"Logical scenario"</i> means a traffic<br>scenario elaborated at a lower level of<br>abstraction to include value ranges or<br>probability distributions for each<br>element of the corresponding<br>functional scenario. <sup>14</sup>   |   |  |
| 3.38.7. | <i>"Concrete scenario"</i> means a traffic<br>scenario at a level of abstraction in<br>which specific values have been<br>selected for each element from the<br>continuous ranges as may be defined in<br>the corresponding logical scenario.  |   |  |
| 3.38.8. | <i>"Complex scenario"</i> means a traffic<br>scenario containing one or more<br>situations that involve <b>partly</b><br><b>dependent parameters that must be</b><br><b>taken into account by the ADS to</b><br><b>execute the DDT of the ADS (e.g.,</b> a<br>large number of other road users,<br>unlikely road infrastructure, or<br>abnormal geographic/environmental<br>conditions). | (Germany) Increase abstraction level. Extend<br>proposal to include the entire DDT. |  |

<sup>&</sup>lt;sup>13</sup> Declarative descriptions can include structured natural language, programming language or other forms of languages that meet the required criteria (formalized and declarative).
 <sup>14</sup> For example, elaborating the lane element to cover possible lane widths.

| 2.20  |  |   |  |
|-------|--|---|--|
| 3.39. | System-initiated deactivation of the<br>ADS means a procedure by which the<br>ADS initiates the transfer of<br>performance of the DDT from the ADS<br>to a vehicle fallback user.  |   |  |
| 3.40. | <i>User-initiated deactivation of the ADS</i><br>means a procedure by which the user<br>initiates the transfer of performance of<br>the DDT from the ADS to [a/the]<br>vehicle user.   | (Open issue) Can any user assume control of the<br>DDT or is this limited to a fallback user? Can any<br>user initiate the deactivation of the ADS<br>performance of the DDT? Could a user initiate a<br>deactivation as part of a fallback to an MRC (i.e.,<br>transfer not always to a user)? |  |
| 3.40. | <i>"(ADS) User"</i> means a human user of an ADS vehicle.  |   |  |
| 3.41. | <i>"Useful life (of an ADS vehicle)"</i><br>means the duration during which an<br>ADS vehicle is in an operational state<br>under which it may be driven on public<br>roads regardless of the operational state<br>of the ADS.   |   |  |
| 3.42. | <i>"Validation of the simulation model"</i><br>means the process of determining the<br>degree to which a simulation model is<br>an accurate representation of the real<br>world from the perspective of its<br>intended uses.  |   |  |
| 3.43. | <i>"Verification of the simulation model"</i><br>means the process of determining the<br>extent to which a simulation model or a<br>virtual testing tool is compliant with its<br>requirements and specifications as<br>detailed in its conceptual models,<br>mathematical models, or other<br>constructs. |   |  |

| 3.44. | <i>"Virtual testing"</i> means the process of testing a system using one or more simulation models.  | <i>"Virtual Testing"</i> means a type of testing that<br>uses a simulation toolchain to assess the<br>performance of the ADS. |  |
|-------|--|---|--|
| 3.45. | <i>"Driver-In-the-Loop" (DIL)</i> means a driving simulator with components to enable the driver to operate in and communicate with the virtual environment and used to assess the human-automation interaction design.  |   |  |
| 3.46. | <i>"Hardware-In-the-Loop"</i> (HIL) means<br>the hardware of a specific vehicle<br>subsystem running the software with<br>input and output connected to a<br>simulation environment to replicate<br>sensors, actuators, and/or mechanical<br>components in a way that connects all<br>the I/O of the Electronic Control Units<br>(ECU) before the final system is<br>integrated. |   |  |
| 3.47. | <i>"Model-In-the-Loop"</i> (MIL) means<br>high-level-of-abstraction software<br>frameworks running on general-<br>purpose computing systems to enable<br>quick algorithmic development without<br>involving dedicated hardware.  |   |  |

| 3.48. | <i>"Software-In-the-Loop"</i> (SIL) means a methodology where executable code such as algorithms, an entire controller strategy, or a complete software implementation is assessed within a modelling environment on general-purpose computing systems. |   |  |
|-------|---|---|--|
| 3.49. | <i>"Vehicle -In-the-Loop"</i> (VIL) means a fusion of real-world and virtual environments to assess the dynamics of a physical ADS vehicle on a vehicle test bed or a test track at the same level as real-world testing.                               |   |  |
| 3.50. | <i>"Remote termination"</i> means rendering<br>one or multiple ADS or ADS features<br>unable to be activated by the user.   | <ul> <li>(OPI) New definition proposed to enable safety requirement.</li> <li>(Secy)</li> <li>Is "termination" limited to performance of the DDT?</li> <li>Is "termination" limited to activation of DDT performance?</li> <li>Is this wording referring to a single ADS vehicle or does it envision disabling multiple vehicles?</li> <li>Is "by the user" necessary?</li> <li>Phrasing "one or more" is more concise than "one or multiple".</li> </ul> |  |

| 4.     | General requirements  |  |
|--------|---|--|
| 4.1.   | Safety Management System  |  |
| 4.1.1. | To facilitate the approval authority's<br>audit and safety assessment, the ADS<br>manufacturer should provide certain<br>specific documentation.                                    |  |
| 4.1.2. | It is recommended that the documentation package shows that the ADS:  |  |
| (a)    | Is designed and was developed to<br>operate in such a way that it is free<br>from unreasonable risks for the ADS<br>vehicle user(s) and other road users<br>within the declared ODD |  |
| (b)    | Respects any applicable performance<br>requirements concerning performance<br>of the DDT and interaction with ADS<br>users  |  |
| (c)    | Was developed according to the development process/method declared by the manufacturer.   |  |
| 4.1.3. | Documentation should be made available in three parts:  |  |
| (a)    | An information document which is<br>submitted to the authority and should<br>contain a brief overview of the separate<br>documents provided   |  |
| (b)    | For the purpose of conducting the<br>audit, a complete description of the<br>manufacturer's Safety Management<br>System   |  |
| (c)    | For the purpose of conducting the safety assessment, a complete safety  |  |

|        | case for the ADS and its features,<br>including a description of the design<br>processes used to implement the safety<br>concept, and a structured presentation<br>demonstrating through a body of<br>evidence that the ADS and its feature<br>have undergone sufficient safety<br>validation to ensure an absence of<br>unreasonable risk in the ADS's<br>performance. |  |  |
|--------|---|--|--|
| 4.1.4. | Additional confidential material and<br>analysis data (e.g. intellectual property)<br>open for inspection (e.g. on-site in the<br>engineering facilities of the<br>manufacturer) at the time of the<br>product assessment/process audit.  |  |  |
| 4.1.5. | The manufacturer shall ensure that this<br>material and analysis data remains<br>available for a period of 10 years<br>counted from the time when production<br>of the ADS is discontinued. Any<br>changes to ADS safety design shall be<br>communicated as required to the<br>relevant authority.  |  |  |
| 4.2.   | ADS performance of the DDT  |  |  |
| 4.2.1. | As a general concept, the safety level<br>of ADS shall be at least to the level at<br>which a competent and careful human<br>driver could minimize the unreasonable<br>safety risks to the ADS vehicle user(s)<br>and other road users.   | (OPI) Open item: Significant further discussion is<br>required to explain what is meant by competent<br>and careful human driver in this context |  |
| 4.2.2. | The ADS shall be capable of<br>performing the entire Dynamic Driving<br>Task (DDT) within the ODD of its<br>feature(s).   |  |  |

| 4.2.3. | The manufacturer shall use a process to<br>derive behavioural competencies and<br>scenarios that are ODD-relevant. The<br>methodology used in Annex [x] can be<br>used or alternative methods providing<br>they are equally comprehensive. | ADS-03: Provision accepted pending further work on ODD framework annex.  |  |
|--------|--|--|--|
| 4.3.   | ADS interactions with user(s)  |  |  |
| 4.4.   | Safety Assessment  |  |  |
| NEW    |  | Virtual Testing Credibility Assessment   |  |
|        |  | The manufacturer shall demonstrate that the approach to testing is suitable for the demonstration of the safety case and the compliance with performance/functional requirements.  |  |
|        |  | The manufacturer shall demonstrate that the<br>physical testing (proving ground and/or public<br>road) facilities and environment are suitable for<br>the tests that are being conducted.  |  |
|        |  | The manufacturer shall demonstrate that the simulation toolchain(s) is suitable for conducting virtual tests. The requirements for the simulation toolchain are listed in 5.X.   |  |
| 4.5.   | In-Service Monitoring and Reporting  |  |  |
| 4.5.1. | The ADS's safety performance remains<br>the responsibility of the manufacturer<br>throughout the lifetime of the ADS.  | <ul> <li>(OPI)</li> <li>The ISMR of the Manufacturers shall ensure the ADS's safety throughout the lifetime of the ADS.</li> <li>(Secy)</li> <li>Please clarify. This appears to be an objective, not a requirement. How would the requirement to ensure safety be met before the ADS under assessment has been put in service? What is the meaning of "lifetime of the ADS"?</li> </ul> |  |

| 4.5.2.   | The manufacturer shall put in place a feedback loop (fleet monitoring) to confirm the safety argument and confirm the validation carried out by the manufacturer before market introduction.                  | (OPI)<br>4.5.1.1. | The manufacturer shall put in place<br>a fleet monitoring mechanism to<br>collect information from the ADS<br>vehicle in accordance with the<br>requirement listed in the 5.7.2.:   |               |
|----------|---|-------------------|---|---------------|
|          |   | (OPI)             | <ul> <li>(a) to confirm the safety case and<br/>confirm the validation carried<br/>out by the manufacturer before<br/>market introduction.</li> </ul>   | (GTR variant) |
|          |   | (Secy)            | Inappropriate wording for a GTR.<br>("market introduction" inconsistent<br>certification on the date of<br>manufacture of the vehicle.)   |               |
|          |   | (OPI)             | <ul> <li>(a) to confirm the safety case and<br/>confirm the validation carried<br/>out by the manufacturer before<br/>the granting of the approval.</li> </ul>  | (UNR variant) |
| 4.5.2.1. | This information shall enable the<br>identification of unreasonable risks<br>related to the use of an ADS on public<br>roads and the evaluation of its safety<br>performance during real-world<br>operation.  | (OPI)             | <ul> <li>b) to enable the identification<br/>of unreasonable risks<br/>related to the use of an ADS<br/>on public roads and the<br/>evaluation of its safety<br/>performance during real-<br/>world operation.</li> </ul> |               |
| 4.5.2.2. | This information shall enable the<br>identification of unanticipated<br>situations, risks, and hazards during<br>real-world ADS operation, and this<br>information shall be used to develop<br>new scenarios. | (OPI)             | c) to enable the identification<br>of unanticipated situations,<br>hazards, and risks that lead<br>to unexpected behaviour of<br>the ADS.   |               |

|                    |  | 4.5.1.2. The manufacturer shall put in place<br>a reporting mechanism in<br>accordance with the requirement<br>listed in the 5.7.3:   |  |
|--------------------|--|---|--|
| 4.5.2.4.           | ADS manufacturers shall collect and<br>analyse the safety-relevant information<br>related to their in-service ADS'<br>operation and report data that identifies<br>situations which fall into the cases<br>specified for short term and periodic<br>reporting. | <ul> <li>a) To collect, analyse the safety-<br/>relevant information related to<br/>its in-service ADS' operation<br/>that identifies situations which<br/>fall into the cases specified for<br/>short term and periodic<br/>reporting.</li> </ul>      |  |
| 4.5.2.3.           | The manufacturer shall also put in<br>place a mechanism that allows<br>information from the ISMR and<br>recommendations from its analysis to<br>be shared with the relevant authority.   | b) that allows information from<br>the ISMR and<br>recommendations from its<br>analysis to be shared with the<br>relevant authority.  |  |
|                    |  | 4.5.1.3. The manufacturer shall also have a mechanisms for receiving and analysing safety relevant feedback and reports from other sources, in accordance with the requirement listed in the 5.7.2, to complement the data collected from ADS vehicles. |  |
| 4 <del>.5.3.</del> | Before the deployment of the ADS, the<br>manufacturer shall establish processes<br>to demonstrate its capabilities to<br>execute an effective ISMR.  | ADS-03: OPI proposal to delete.   |  |
| 4.5.4.             | The ISMR shall fulfil three main<br>objectives:<br>(a) Identify safety risks related to<br>ADS performance that need to be<br>addressed, including instances of<br>non compliance with ADS safety<br>requirements.   | (OPI) Propose to delete.  |  |

| <ul> <li>(b) Support the development of<br/>testable traffic scenarios through<br/>capturing information when the<br/>ADS does not perform safely in<br/>unanticipated situations.</li> <li>(c) Share information and<br/>recommendations to promote<br/>continuous improvement of ADS<br/>safety performance.</li> </ul> |                          |  |
|---|--------------------------|--|
| 4.5.5. Manufacturers may be expected to<br>collect data relevant to typical<br>operations such as dealer reports,<br>customer reports, etc. to complement<br>the data that shall be collected and<br>uploaded by the manufacturer from<br>ADS vehicles.   | (OPI) Propose to delete. |  |
| ISMR specifications   |                          |  |

| 5 | . Requirements/specifications |  |
|---|-------------------------------|--|
|   | 1 1                           |  |

| 5.1.   | Safety Management System  |   |  |
|--------|---|---|--|
| 5.1.1. | In respect of ADS, the manufacture<br>shall have robust processes to manage<br>safety risks and to ensure safety<br>throughout the ADS lifecycle<br>(development, production, operation<br>and decommissioning). It shall include<br>taking appropriate measures to monitor<br>the vehicle during the in-service<br>operation and to take the corrective<br>remedial action when necessary. | (OPI)<br>In respect of ADS, the manufacturer shall<br>establish an SMS with robust processes to<br>manage safety risks and to ensure safety<br>throughout the ADS lifecycle (development,<br>production, operation and decommissioning)<br>including in the event of discontinued production,<br>support, or maintenance. |  |

| ma<br>an<br>(a) | <ul> <li>n SMS is a systematic approach to<br/>anaging safety, which encompasses<br/>and integrates organizational, human<br/>and technical factors:</li> <li>) Human component ensuring the<br/>ADS lifecycle is monitored by<br/>personnel with appropriate skills,<br/>training, and understanding to<br/>identify risks and appropriate<br/>mitigation measures to identify<br/>risks and appropriate mitigation<br/>measures while accounting for the<br/>possibility of human errors.</li> <li>) Organisational component<br/>procedures and methods that help<br/>to manage the identified risks,<br/>understand their relationships and<br/>interactions with other risks and<br/>mitigation measures, and help to<br/>ensure that there are no<br/>unforeseen consequences.</li> </ul> | Moved to <u>definition</u> per ADS-03 decision. |  |
|-----------------|---|---|--|
| <del>(c)</del>  | <ul> <li>Uniforeseen consequences.</li> <li>Technical component using<br/>appropriate tools and equipment.</li> </ul>   |   |  |

| 5.1.3.   | An SMS incorporating all three factors<br>to monitor and improve safety and<br>helping to control the identified risks<br>may be evaluated as adequate. The<br>SMS evaluation may be based on<br>automotive (or other industry)<br>engineering standards, guidebooks, and<br>best practice documents relevant to<br>safety.   | (OPI)<br>The SMS shall manage safety by considering<br>organizational, human and technical risk factors.                                  |  |
|----------|---|---|--|
| 5.1.4.   | Safety Policy   |   |  |
| 5.1.4.1. | It is required that a safety policy be<br>included in the SMS to outline the aims<br>and objectives that the organisation<br>uses to achieve the desired safety<br>outcomes. The policy shall declare the<br>principles and philosophies that lay the<br>foundation for the organisation's safety<br>culture and be communicated to all<br>staff throughout the organisation. | (OPI)<br>The safety policy shall outline the aims and<br>objectives that the organization uses<br>to achieve the desired safety outcomes. |  |

| f  | The manufacturer shall document<br>ollowing contents for the sake of<br>nplementing SMS:   | <ul> <li>(OPI)<br/>The manufacturer shall provide evidence it has<br/>implemented the following as part of its SMS:</li> <li>(Secy)<br/>ADS-03 agreed to remove "e.g." references from<br/>the text because they provide guidance, not<br/>requirements. Proposals below reintroduce such<br/>references. The IWG may wish to consider: <ul> <li>moving these "e.g." references to an<br/>annex or reference document.</li> <li>Linking this topic to the work on listing<br/>"regulations, standards, etc." relevant to<br/>the ADS regulation.</li> <li>Cross-referencing requirements with<br/>external references deemed useful<br/>towards understanding the requirements.</li> </ul> </li> </ul> |  |
|----|--|--|--|
| (; | a) Safety policies and principles.   | <ul> <li>(a) Safety policies and principles (e.g.,<br/>ISO 21434, para. 5.4.1 and ISO 9001<br/>Automotive 5.2)</li> </ul>  |  |
| (1 | b) Organisation safety objectives and<br>the process for creating safety<br>performance indicators used in<br>the safety case.   |  |  |
|    | c) Appropriate structure for SMS,<br>taking into account regulation,<br>standards, best practice guidance<br>and the use-case of the vehicle<br>and mapping its organisation<br>structure, processes, and work<br>products onto the SMS. |  |  |
| (1 | d) Safety culture.   | (d) Safety culture ((e.g., ISO 26262-2, para. 5.4.2).  |  |
| (( | <ul> <li>e) Safety Governance elements<br/>including:</li> <li>(i) Management commitment</li> <li>(ii) Roles and responsibilities.</li> </ul>  | <ul> <li>(e) Safety Governance elements including:</li> <li>(i) Management commitment</li> <li>(e.g., ISO 21434, para. 5.4.1 and</li> <li>ISO 9001 Automotive 5.1)</li> </ul>  |  |

|          |  | <ul> <li>(ii) Roles and responsibilities (e.g.,<br/>ISO 26262-2, para. 6.4.2, this<br/>relates to the organizational and<br/>project dependent activities).</li> </ul>  |  |
|----------|--|---|--|
|          | (f) Effective communications within the organization on safety issues;   | <ul> <li>(f) Effective communications within the organization on safety issues (e.g., ISO 26262-2, para. 5.4.2.3).</li> </ul>   |  |
|          | (g) Information sharing outside of the organization.   | <ul> <li>(g) Information sharing outside of the organization (e.g., ISO 21434, para. 5.4.5 and ISO 9001, but from a safety perspective).</li> </ul>   |  |
|          | <ul> <li>(h) Quality Management System to<br/>support safety engineering,<br/>including change management,<br/>configuration management,<br/>requirement management, tool<br/>management etc.</li> </ul>   | <ul> <li>(h) Quality Management System (e.g.,<br/>IATF 16949 or ISO 9001) to support<br/>safety engineering, including change<br/>management, configuration<br/>management, requirement<br/>management, tool management, etc.</li> </ul>  |  |
| 5.1.5.   | Risk Management  |   |  |
| 5.1.5.1. | It is required to include in the SMS a<br>Safety risk management process to<br>identify and assess the risks associated<br>to the three SMS factors (i.e., human,<br>organizational, and technical). Any<br>operational risk identified in the<br>product shall, where appropriate, have<br>mitigations implemented during the<br>Design and Development phase. The<br>ADS manufacturer shall then be able<br>to show the link between the overall<br>risk management process, the<br>mitigations, and the resulting<br>operational risks. | <ul> <li>(OPI)</li> <li>The manufacturer shall include in the SMS a safety-risk management process to identify and assess the risks associated to the three SMS factors (i.e., human, organizational, and technical). Any operational risk identified in the product shall, where appropriate, have mitigations implemented. The ADS manufacturer shall then be able to show the link between the overall risk management process, the mitigations, and the resulting operational risks.</li> <li>(Secy)</li> <li>This paragraph contains at least three distinct requirements that should be separated: <ul> <li>Explain risk-management process</li> <li>Mitigate identified risks</li> </ul> </li> </ul> |  |

|          |  | <ul> <li>Show link among overall risk<br/>management, mitigations, and resulting<br/>risks.</li> <li>The provision should be clarified and perhaps<br/>linked to the ADS safety-case documentation. It<br/>seems to confuse documenting the manufacturer's<br/>processes with the outcomes of those processes<br/>(mitigations and effectiveness) as documented in<br/>the safety case of the ADS under assessment.</li> </ul> |  |
|----------|--|--|--|
| 5.1.5.2. | The manufacturer shall document its<br>risk management processes and<br>activities which may include the<br>following aspects: | Risk management processes and activities shall<br>be documented considering relevant standards<br>and best practice. They shall include:   |  |
|          | (a) Risk identification  | (a) Risk identification (e.g., ISO 31000 para. 6.4.2).   |  |
|          | (b) Risk analysis.   | (b) Risk analysis (e.g., ISO 31000 para. 6.4.3).   |  |
|          | (c) Risk evaluation.   | (c) Risk evaluation (e.g., ISO 31000 para. 6.4.4).   |  |
|          | (d) Risk treatment.  | (d) Risk treatment (e.g., ISO 31000 para.<br>6.4.5 standard or equivalent).  |  |
|          | (e) Processes for keeping the risk assessments up to date.   | (e) Processes for keeping the risk assessments up to date.   |  |
|          | (f) Review of safety performance of the organization and effectiveness of safety risk controls.                                | <ul> <li>(f) Review of safety performance of the organization and effectiveness of safety risk controls.</li> </ul>  |  |

| 5.1.6.   | Design and Development Process   |  |  |
|----------|--|--|--|
| 5.1.6.1. | It is required that the design and<br>development process is well<br>established and documented in the<br>SMS. It shall include risk<br>management, requirements | The manufacturer shall document its processes<br>and activities to ensure proper deployment of the<br>SMS principles during the design and<br>development phase. This documentation shall<br>include risk management, requirements |  |

|          | management, requirements'<br>implementation, testing, failure<br>tracking, remedial actions, and release<br>management which may include the<br>following aspects:  | management, requirements' implementation,<br>testing, failure tracking, remedial actions, and<br>release management which may include the<br>following aspects:   |  |
|----------|---|---|--|
|          | <ul> <li>(a) Roles and responsibilities of the<br/>people involved during the design<br/>and development phase.</li> </ul>  |   |  |
|          | (b) Qualifications and experience of<br>persons responsible for making<br>decisions that affect safety.   |   |  |
|          | <ul> <li>(c) Coordination of roles,<br/>responsibilities and information<br/>transfer between design and<br/>production activities.</li> </ul>  |   |  |
| 5.1.6.2. | The manufacturer shall document its<br>processes and activities which may<br>include the following aspects to ensure<br>the robustness of the design and<br>development phase:  | The manufacturer shall document its processes<br>and activities to ensure the robustness of the<br>design and development phase. This<br>documentation shall cover, at least, the following<br>aspects: |  |
|          | <ul> <li>(a) A general description of how the organization performs all the design and development activities.</li> </ul>   |   |  |
|          | <ul> <li>(b) Vehicle/system development,<br/>integration, and implementation:</li> <li>(i) Requirements management<br/>(e.g. Requirement capture<br/>and validation)</li> <li>(ii) Validation strategies,<br/>including but not limited to:</li> <li>a. Assessment of the<br/>physical testing<br/>environment</li> </ul> |   |  |

| <ul> <li>b. Credibility assessment<br/>for virtual tool chain</li> <li>c. System integration</li> <li>d. Software</li> <li>e. Hardware.</li> <li>(iii) Management of functional<br/>Safety and operational<br/>safety, including the ongoing<br/>evaluation and update of risk<br/>assessments and<br/>interactions.</li> <li>(iv) Management of Human<br/>Factors (e.g. Human-centred<br/>design processes).</li> </ul> |   |  |
|--|---|--|
| <ul> <li>(c) Design and change management, including but not limited to:</li> <li>(i) The major design decisions.</li> <li>(ii) The relevant design modifications to the ADS.</li> <li>(iii) The personnel involved in the design.</li> <li>(iv) The tools and thresholds adopted for the ADS safety verification.</li> </ul>  |   |  |
| 5.1.6.3. It is required that the manufacturer<br>institutes and maintains effective<br>communication channels between the<br>departments responsible for<br>functional/operational safety,<br>cybersecurity and any other relevant<br>disciplines related to the achievement<br>of vehicle safety.   | The manufacturer shall institute and maintain<br>effective communication channels between the<br>departments and third-party organizations<br>responsible for functional/operational safety,<br>cybersecurity and any other relevant disciplines<br>related to the achievement of vehicle safety.<br>These processes and activities shall be<br>documented considering relevant standards and<br>best practice.<br>(Secy) Rephrase: the text should state what is<br>required (documentation showing effective<br>channels, etc.) |  |

| 5.1.7.   | Production and Deployment Process   | Production Process  |
|----------|---|---|
| 5.1.7.1. | It is required that the production<br>process shall be well established and<br>documented in the SMS. The<br>manufacturer shall document its<br>processes and activities which may<br>include the following aspects to ensure<br>the robustness of the development and<br>the production phase: | The manufacturer shall establish and document<br>the production process in the SMS. The<br>manufacturer shall document its processes and<br>activities to ensure the robustness of the<br>production phase. This documentation shall<br>cover, at least, the following aspects:<br>(Secy) Propose to delete the first sentence<br>(redundant). Propose to replace the third sentence<br>with ", including:" |
|          | (a) Quality Management System accreditation   | (a) Quality Management System<br>accreditation (e.g., IATF 16949 or ISO<br>9001)  |
|          | (b) A description of the way in which<br>the organisation performs all the<br>production functions including<br>management of working<br>conditions, working environment,<br>equipment and tools.   |   |
| 5.1.7.2. | The manufacturer shall document its<br>processes and activities which may<br>include the following aspects to ensure<br>the robustness of the development and<br>distributed production:  | The manufacturer shall establish and document<br>their distributed production processes and<br>activities in the SMS. The processes and<br>activities may include:  |
|          | <ul> <li>(a) Liaison between the vehicle<br/>and/or ADS manufacturer and all<br/>other organisations (partners or<br/>subcontractors) involved</li> </ul>   |   |
|          | <ul> <li>(b) Criteria for the acceptability of<br/>"subsystem/components"<br/>manufactured by other partners or<br/>subcontractors. (i.e., deployment</li> </ul>  |   |

| of production assurance        |  |
|--------------------------------|--|
| requirements to supply chain). |  |

| 5.1.7.3. | It is required that the manufacturer<br>demonstrate that periodic independent<br>internal audits and external audits are<br>carried out to ensure that the processes<br>established for the Safety Management<br>System are implemented consistently.   | The manufacturer shall demonstrate that periodic<br>independent internal audits and external audits<br>are carried out to ensure that the processes<br>established for the Safety Management System<br>are implemented consistently.<br><i>Note: Move to a new section 5.10. "Safety</i><br><i>Assurance Process".</i>  |  |
|----------|---|---|--|
| 5.1.7.4. | It is required that the SMS include a<br>robust process to ensure that post-<br>deployment software updates are<br>properly validated and distributed and<br>downloading is confirmed.  | The manufacturer shall include a robust process<br>in the SMS to ensure that post-deployment<br>software updates are properly validated and<br>distributed and downloading is confirmed.<br><i>Note: Move to a new section 5.9. "Post<br/>Deployment Process".</i>  |  |
| 5.1.7.5. | It is required that the manufacturer<br>put in place suitable arrangements (e.g.,<br>contractual arrangements, clear<br>interfaces, quality management system)<br>with any organization involved in the<br>development, manufacturing, or in-use<br>deployment of its vehicles (e.g.,<br>contracted suppliers, service providers,<br>or manufacturers' sub-organizations).<br>The manufacturer shall document its<br>processes and activities which may<br>include the following aspects: | Note: Move to a new section 5.10. "Safety<br>Assurance Process".<br>The manufacturer shall put in place suitable<br>arrangements (e.g., contractual arrangements,<br>clear interfaces, quality management system)<br>with any organization involved in the<br>development, manufacturing, or in-use<br>deployment of its vehicles (e.g., contracted<br>suppliers, service providers, or manufacturers'<br>sub-organizations). The manufacturer shall<br>document its processes and activities which may<br>include the following aspects: |  |
|          | (a) Organizational policy for supply chain  |   |  |
|          | (b) Incorporation of risks originating from supply chain  |   |  |
|          | (c) Evaluation of supplier SMS<br>capability and corresponding<br>audits  |   |  |

|                     | <ul> <li>(d) Processes to establish contracts, agreements for ensuring safety across the phases of development, production, and post-production</li> </ul>  |   |  |
|---------------------|---|---|--|
|                     | (e) Processes for distributed safety activities.  |   |  |
| 5.1.7.6.            | SMS documentation shall be regularly<br>updated in line with any relevant<br>changes to the SMS processes. It is<br>required that gap analysis shall be used<br>when auditing and updating the SMS,<br>examining the current safety culture<br>before formulating new and more<br>appropriate SMS processes to ensure<br>issues are adequately resolved. The<br>SMS shall be subject to a process of<br>continual improvement. Any changes to<br>SMS documentation shall be<br>communicated as required to the<br>relevant authority. | SMS documentation shall be regularly updated in<br>line with any relevant changes to the SMS<br>processes. It is required that gap analysis shall be<br>used when auditing and updating the SMS,<br>examining the current safety culture before<br>formulating new and more appropriate SMS<br>processes to ensure issues are adequately<br>resolved. The SMS shall be subject to a process<br>of continual improvement (e.g. "Plan, Do, Check,<br>Act" as described in ISO 9001). Any changes to<br>SMS documentation should be communicated as<br>required to the relevant authority.<br><i>Note: Move to a new sub-section 5.10. "Safety<br/>Assurance Process" except the third sentence.</i><br><i>Note: The last two sentences would be moved to a<br/>new section 5.11. "Safety Promotion"</i> |  |
| <del>5.1.7.7.</del> | It is required that the SMS address<br>measures to be taken to ensure ADS<br>safety in the event of discontinued<br>production, support, or maintenance of<br>the ADS.  | Note: Due to overlap, delete this text. Add<br>"including in the event of discontinued<br>production, support, or maintenance." to the end<br>of 5.4.1.   |  |
| 5.1.7.8.            | It is required that the manufacturer has processes for:   | Note: Move to a new sub-section 5.10. "Safety<br>Assurance Process".<br>The manufacturer shall have processes for:  |  |
|                     | (a) Assuring that all practices and<br>activities documented as part of<br>the SMS are followed   | The manufacturer shart have processes for.  |  |

| <ul> <li>(b) Assuring that an independent<br/>check of compliance with the<br/>applicable requirements is<br/>performed. (i.e., not from person<br/>creating the compliance data)</li> </ul> |   |  |
|--|---|--|
| <ul> <li>(c) Assuring the continued evaluation<br/>of the Safety Management System<br/>so that it remains effective.</li> </ul>  |   |  |
|  | 5.9. Post deployment process  |  |
|  | 5.9.1. The manufacturer shall establish processes<br>to demonstrate its capabilities to execute an<br>effective ISMR and to take the corrective<br>remedial action when necessary.  |  |
|  | 5.9.2. The processes for ISMR shall demonstrate the capabilities:   |  |
|  | (a) To monitor ADS operations   |  |
|  | (b) To confirm the compliance with the<br>defined safety case and compliance to<br>the performance requirements   |  |
|  | (c) To identify safety risks related to ADS<br>performance that need to be addressed<br>in the frame of the SMS activities,<br>including instances of non-compliance<br>with ADS safety requirements                                      |  |
|  | <ul> <li>(d) To manage potential safety-relevant<br/>gaps during the in-service operation<br/>and to provide the information that<br/>allows the ADS to be updated<br/>according to the appropriate<br/>manufacturer processes</li> </ul> |  |
|  | (e) To support the development of new or revise existing scenarios  |  |
|  | (f) To perform event investigation  |  |

| (g)     | To report occurrences to the relevant authority when they occur   |  |
|---------|---|--|
| (h)     | To share learnings derived from occurrence analysis   |  |
| (i)     | To contribute to the continuous improvement of automotive safety.   |  |
| 5.9.3.  | The process for ISMR shall<br>demonstrate the capabilities for<br>handling the reports received from<br>other sources, including<br>distinguishing false reports from<br>actual events and conducting<br>thorough investigations when<br>necessary. |  |
| 5.9.4.  | The manufacturer shall include a<br>robust process in the SMS to ensure<br>that post-deployment software<br>updates are properly validated and<br>distributed and downloading is<br>confirmed.  |  |
| 5.10.   | Safety Assurance Process  |  |
| 5.10.1. | The manufacturer shall define<br>appropriate Key Performance<br>Indicators (KPI) to measure the<br>effectiveness of ISMR activities for<br>the ADS operations.  |  |
| 5.10.2. | The manufacturer shall demonstrate<br>that periodic independent internal<br>audits and external audits are<br>carried out to ensure that the<br>processes established for the Safety<br>Management System are<br>implemented consistently.          |  |

| 5.10.3. | The manufacturer shall put in place<br>suitable arrangements (e.g.,<br>contractual arrangements, clear<br>interfaces, quality management<br>system) with any organization<br>involved in the development,<br>manufacturing, or in-use<br>deployment of its vehicles (e.g.,<br>contracted suppliers, service<br>providers, or manufacturers' sub-<br>organizations). The manufacturer<br>shall document its processes and<br>activities which may include the<br>following aspects: |  |
|---------|--|--|
| (a)     | Organizational policy for supply chain;  |  |
| (b)     | Incorporation of risks originating from supply chain;  |  |
| (c)     | Evaluation of supplier SMS capability and corresponding audits;  |  |
| (d)     | Processes to establish contracts,<br>agreements for ensuring safety<br>across the phases of development,<br>production, and post-production;   |  |
| (e)     | Processes for distributed safety activities.   |  |
| 5.10.4. | SMS documentation shall be<br>regularly updated in line with any<br>relevant changes to the SMS<br>processes. It is required that gap<br>analysis shall be used when auditing<br>and updating the SMS, examining<br>the current safety culture before<br>formulating new and more<br>appropriate SMS processes to  |  |

| ensure issues are adequately resolved.  |  |
|---|--|
| The manufacturer shall have has processes for:  |  |
| (a) Assuring that all practices and activities documented as part of the SMS are followed;  |  |
| (b) Assuring that an independent check<br>of compliance with the applicable<br>requirements is performed. (i.e., not<br>from person creating the compliance<br>data);   |  |
| (c) Assuring the continued evaluation<br>of the Safety Management System<br>so that it remains effective.   |  |
| 5.11 Safety Promotion Process   |  |
| 5.11.1. The SMS shall be subject to a process of continual improvement (e.g. "Plan, Do, Check, Act" as described in ISO 9001). Any changes to SMS documentation should be communicated as required to the relevant authority. |  |

| 5.2.     | ADS performance of the DDT   |   |
|----------|--|---|
| 5.2.1.   | ADS Performance of the DDT under<br>Nominal Traffic Scenarios  | (Definitions OPI) There is a problem with the<br>"nominal scenario" <u>definition</u> . The "nominal"<br>requirements were based on the FRAV "starting<br>point" that "the ADS shall drive safely". These<br>requirements aimed to satisfy the AV Framework<br>Document stipulation that, among other things,<br>ADS "shall not cause any traffic accidents<br>resulting in injury or death that are reasonably<br>foreseeable and preventable". Therefore, the<br>scenarios used for assessing compliance with<br>these requirements must be those where a<br>collision is "preventable". Moreover, the<br>scenarios need to be limited to those that isolate<br>the ADS driving behaviour from other possible<br>causes of a collision. The definition of a "nominal<br>scenario" based on what can be "expected" is too<br>broad and open to scenarios with ORU<br>behaviours or sudden events that, while<br>"expectable", present unavoidable collisions. As a<br>result, legitimate calls are being made to dilute<br>the "nominal" requirements to account for<br>foreseeable ("expectable") situations where the<br>requirements cannot be met. |
| 5.2.1.1. | The ADS shall operate the vehicle at safe speeds.  | (OPI) The ADS shall adapt its speed in line with safety risks.  |
| 5.2.1.2. | The ADS shall maintain appropriate<br>distances from other road users by<br>controlling the longitudinal and lateral<br>motion of the vehicle. |   |
| 5.2.1.3. | The ADS shall adapt its driving<br>behaviour to the surrounding traffic<br>conditions in order to avoid disruption<br>to the flow of traffic.  | (OPI) The ADS shall [aim to] avoid unreasonable disruption to the flow of traffic in line with safety risks.  |

| 5.2.1.4. | The ADS shall adapt its driving behaviour in line with safety risks.   |  |   |
|----------|--|--|---|
| 5.2.1.5. | The ADS shall detect and respond to objects and events relevant to its performance of the DDT;                                   |  |   |
| 5.2.1.6. | The ADS shall detect and respond to<br>priority vehicles <b>in service</b> in<br>accordance with the relevant traffic<br>law(s). | (OPI) Proposal to delete "in-service". Concept of<br>"in service" is covered by the definition of<br>priority vehicles ("Priority vehicle" means a<br>vehicle subject to exemptions, authorizations,<br>and/or right-of-way under traffic laws while<br>performing a specified function.") | OPI: Depends on ensuring the "priority vehicle"<br>definition revision maintains concept that the<br>vehicle is in service.<br>France: accept removal provided definition<br>captures "in-service". |

| 5.2.1.7.  | The ADS shall not force other road<br>users to take evasive action to avoid a<br>collision with the ADS vehicle.   | (OPI) Discussion on possibly inserting "aim not to"  |  |
|-----------|--|--|--|
| 5.2.1.8.  | The driving behaviour of the ADS shall not cause a collision.  | (OPI) Proposal to delete.<br>(Secy) See <u>comments</u> above.   |  |
| 5.2.1.9.  | The ADS shall comply with traffic<br>rules in accordance with application of<br>relevant law within the area of<br>operation.  |  |  |
| 5.2.1.10. | The ADS shall interact safely with other road users.   |  |  |
| 5.2.1.11. | The ADS shall avoid collisions with safety-relevant objects where possible.  | (OPI) The ADS shall [aim to] avoid collisions<br>with safety-relevant objects <del>where possible</del> .<br>(Secy) See <u>comments</u> above. |  |
| 5.2.1.12. | The ADS shall signal its operational status if required by national rules.   |  |  |
| 5.2.1.13. | Pursuant to a passenger request under para. [7.5.5 a)], the ADS shall bring the vehicle to a safe stop.  |  |  |
| 5.2.2.    | ADS Performance of the DDT under<br>Critical Traffic Scenarios   |  |  |
| 5.2.2.1.  | The requirements for DDT<br>performance under nominal scenarios<br>shall continue to apply during critical<br>scenarios as far as is reasonably<br>practicable under the specific<br>circumstances with the aim of<br>minimising overall risk. |  |  |

| 5.2.2.2.   | In the event of a collision, the ADS<br>shall stop the vehicle in an MRC and/or<br>in accordance with applicable traffic<br>laws.   | <ul> <li>(OPI) In the event of collision involving the ADS vehicle, if required by applicable traffic rules, the ADS shall stop the vehicle in an MRC.</li> <li>(Secy)</li> <li>Is placing a vehicle in an MRC limited to post-collision?</li> <li>Could the response include a fallback to the user (who then puts the vehicle in an MRC)?</li> </ul> |  |
|------------|---|--|--|
| 5.2.2.2.1. | The ADS shall not resume travel until:  | (Secy) Are the subclause AND or OR statements?   |  |
|            | a) the safe operational state of the ADS vehicle has been verified,   | (OPI)<br>a) The safe operational state of<br>the ADS vehicle has been<br>verified and  |  |
|            | b) it is permissible under the<br>applicable law / traffic rule(s),   | (OPI)<br>b) It is permissible under the<br>applicable law.   |  |
|            | c) there are no other safety considerations.  | (OPI) Proposal to delete.  |  |
| 5.2.3.     | ADS Performance of the DDT under<br>Failure Scenarios   | (OPI) There should be a link from this section to<br>the relevant safety concept section for failure<br>analysis.  |  |
| 5.2.3.1.   | The requirements for DDT<br>performance under nominal scenarios<br>shall continue to apply during failure<br>scenarios as far as is reasonably<br>practicable under the specific<br>circumstances with the aim of<br>minimising overall risk. |  |  |
| 5.2.3.2.   | The ADS shall detect faults,<br>malfunctions, and abnormalities that<br>compromise its capability to perform<br>the DDT within the ODD.   |  |  |

| 5.2.3.3.              | The ADS shall execute a fallback<br>response in the event of a failure in the<br>ADS and/or other vehicle system that<br>prevents the ADS from meeting the<br>requirements of this regulation<br>performing the DDT.                            | (OPI) The ADS shall execute a fallback response<br>and prohibit activation in the presence of a fault<br>in the ADS and/or other vehicle system that<br>prevents the ADS from meeting the requirements<br>of this section [5.2].            |  |
|-----------------------|---|---|--|
| 5.2.3.4.              | The ADS may continue to operate in<br>the presence of faults that do not<br>prevent that the ADS from fulfilling the<br>safety requirements of this regulation<br>applicable to the ADS;  | (OPI) In response to a fault, the ADS may<br>continue and adapt its performance of the DDT,<br>in accordance with the severity of any fault<br>provided this resulting performance complies<br>with the requirements of this section [5.2]. |  |
| <del>5.2.3.4.1.</del> | In response to a fault, the ADS may<br>permit activation and use of a feature<br>impacted by the fault provided that the<br>ADS continues to provide the functions<br>necessary to perform the entire DDT.                                      | (OPI) Redundant.  |  |
| 5.2.3.4.2.            | The ADS shall adapt its performance of<br>the DDT in accordance with the<br>severity of the fault to ensure road<br>safety.   | (OPI) Redundant   |  |
| <del>5.2.3.4.3.</del> | The limited operation of the ADS<br>should shall comply with the normally<br>applicable safety requirements of this<br>regulation.  | (OPI) Redundant   |  |
| <del>5.2.3.4.4.</del> | The ADS shall prohibit activation of an ADS feature in the presence of a fault in an ADS function that compromises the ADS capability to comply with the requirements of this regulation. perform the entire DDT within the ODD of the feature. | (OPI) Redundant.  |  |

| 5.2.3.5.   | Remote termination of individual or<br>multiple ADS or feature(s) by the<br>manufacturer and/or service operator<br>shall be possible when requested by<br>Authorities. | <ul> <li>(OPI) Add "remote termination" <u>definition</u>.<br/>Remote termination by the manufacturer and/or service operator shall be possible when requested by Authorities.</li> <li>(Secy)</li> <li>Can this be phrased as an ADS technical requirement? (It doesn't refer to the ADS, so something like "the ADS shall")</li> <li>What is a "service operator"?</li> <li>See questions under definition.</li> </ul>  |
|------------|---|---|
| 5.2.3.5.1. | Remote termination for an ADS<br>performing the DDT shall be capable<br>of triggering an ADS fallback response.   | <ul> <li>(OPI) Remote termination for an ADS performing the DDT shall be capable of triggering an ADS fallback response.</li> <li>(Secy) An "ADS performing the DDT" means that a feature is active. The "termination" definition only refers to blocking activation, not terminating a feature in use. Please clarify the aims of the provisions.</li> </ul>   |
| 5.2.3.5.2. | Remote termination of an ADS or ADS<br>feature(s) shall render them-it unable<br>to be activated by a user.   | <ul> <li>(OPI) Remote termination of an ADS or ADS feature(s) shall render it unable to be activated by a user until such time as the remote termination is rescinded.</li> <li>(Secy) "Termination" is the act of ending something. It is awkward to phrase this as something that can be rescinded (cancelled). It sounds like "remote termination" makes the ADS and/or ADS feature(s) unavailable for use. The provision repeats the definition of "remote termination". It implies a technical requirement that "remote termination" shall be reversible.</li> </ul> |
| 5.2.4.     | ADS Performance of the DDT at ODD Boundaries:   |   |
| 5.2.4.1.   | The ADS shall recognise the conditions<br>and boundaries of the ODD of its<br>feature(s).   |   |

| 5.2.4.2. | The ADS shall be able to determine<br>when the conditions are met for<br>activation of each feature.                        |  |
|----------|---|--|
| 5.2.4.3. | The ADS shall prevent activation of a feature unless the ODD conditions of the feature are met.                             |  |
| 5.2.4.4. | The ADS shall execute a fallback<br>response when one or more ODD<br>conditions of the feature in use are no<br>longer met. |  |
| 5.2.4.5. | The ADS shall be able to anticipate and safely respond to foreseeable exits from the ODD of each feature.                   |  |
| 5.2.5.   | Minimal Risk Condition Requirements   |  |
| 5.2.5.1. | The ADS shall signal its intention to place the vehicle in an MRC.  |  |
| 5.2.5.2. | In the absence of a fallback user, the<br>ADS fallback response shall be to place<br>the vehicle in a MRC.                  |  |

| 5.2.5.3. | If the ADS <b>feature</b> is designed to<br>request and enable intervention by a<br><b>fallback user human driver</b> , the ADS<br>shall execute a fallback to an MRC in<br>the event of a failure in the transition of<br>control to the user. | (OPI) Open Item: It would be useful to have a<br>term to refer to these systems without having to<br>explain them every time, suggest this is covered<br>by user group and TF AVC | (OPI) Would be useful to have term to refer to<br>systems with this fallback to user behaviour.<br>(SAE) When system designed to request user<br>intervention. Technically defined as L4 ADS<br>under SAE/ISO standard. Whether ADS can in all<br>circumstances can achieve an MRC determines<br>line between L3 and L4. Does this require all<br>ADS to have automatic fallback capability (and<br>therefore excludes L3 as defined by SAE).<br>(OPI) Agree with SAE and that's why cannot use<br>"L3" as term for describing this kind of system.<br>(SAE) Not against provision, just noting impact.<br>Provision prohibits L3 ADS due to inability to<br>always achieve an MRC.<br>(SAFE) Does not exclude L3, only states what<br>should happen (fallback to stable, stopped<br>condition)  |
|----------|---|---|--|
|          |   |   | <ul> <li>(ITU) agree with Dan's explanation of L3 regardless of whether definition optimal.</li> <li>(Secy) why feature? (ADS is system, system has functions, functions enable features to perform DDT in ODD—provision seems to address functional capability).</li> <li>(OPI) No objection to dropping feature. Focus on user.</li> <li>(OICA) Might need to revisit definition and use first to many set of the many set o</li></ul> |
| 5.2.5.4. | Upon completion of a fallback to an   |   | of "feature".  |
| 5.2.5.7. | MRC, a user may be permitted to assume control of the vehicle.  |   |  |

| 5.3.       | Interactions between users and ADS  |  |  |
|------------|---|--|--|
| 5.3.1.     | General requirements  |  |  |
| 5.3.1.1.   | The ADS shall signal the presence of a failure that prevents or limits the operation of an available feature.   | (OPI)<br>At each initiation of the powertrain Following<br>a new ignition cycle the ADS shall signal the<br>presence of a failure that prevents or limits the<br>operation of a feature. The ADS shall signal the<br>presence of any failure that limits the operation of<br>an available feature. |  |
| 5.3.1.2.   | The ADS shall signal its intention to place the vehicle in an MRC to the ADS user(s).   |  |  |
| 5.3.1.3.   | An ADS that controls the operation of<br>doors shall provide an emergency<br>override to the user.  |  |  |
| 5.3.1.4.   | The ADS HMI shall provide safety<br>relevant information and signals clearly<br>noticeable to the target user(s) under all<br>operating conditions, multimodal (e.g.,<br>optical, acoustic, haptic) if needed,<br>simply and unambiguously.                   |  |  |
| 5.3.2.     | ADS features that allow a user to take over manual control of the DDT   |  |  |
| 5.3.2.1.   | General requirements  |  |  |
| 5.3.2.1.1. | The ADS shall be designed to prevent misuse and errors in operation by the user.  |  |  |
| 5.3.2.1.2. | When the ADS is active, the vehicle<br>driving controls, direct vision, devices<br>for indirect vision, indicators, tell-tales,<br>and DDT-related warnings may be<br>disabled, suppressed, de-activated,<br>inhibited or by other means made<br>unavailable. | (Secy) What is the meaning of "When the ADS is<br>active?" If it means that the ADS is performing<br>the DDT, it would be appropriate to state, "When<br>an ADS feature is active".  |  |

| 5.3.2.1.3. | The vehicle controls dedicated to the ADS shall be clearly identified and distinguishable to accommodate only the appropriate interactions. <sup>15</sup> |  |  |
|------------|---|--|--|
| 5.3.2.1.4. | While an ADS feature is active, it shall inform the user on:  | (OPI) While an ADS feature is active, it shall inform the user of:                       |  |
|            | (a) ADS status information.   |  |  |
|            | (b) The role of the fallback user, if applicable.   |  |  |
|            | (c) Any failure of the ADS that limits the operation of an available feature.   | (OPI)<br>(c) Adapted performance of the<br>DDT consequent to some<br>failure of the ADS. |  |
| 5.3.2.1.5. | The ADS shall indicate the availability of a feature for activation.  |  |  |

<sup>&</sup>lt;sup>15</sup> Through size, form, location, colour, type, action, spacing and/or control shape. The provision aims to promote correct use and is not intended to prohibit multifunction controls.

| 5.3.2.1.6. | While active, features that have a system-initiated deactivation of the ADS to a fallback user_shall:   | (OPI)<br>While active, features that have a system-initiated<br>deactivation of the ADS to a fallback user shall:  |  |
|------------|---|--|--|
|            | <ul> <li>(a) Continuously assess through a user-monitoring system whether the fallback user is available and in a position to resume the role of driver.</li> </ul> | <ul> <li>(OPI)</li> <li>(a) Continuously assess whether<br/>the fallback user is available to<br/>assume the role of driver at the<br/>end of the deactivation<br/>procedure.</li> </ul> |  |
|            | (b) Provide effective procedures for<br>re-engaging the fallback user who<br>has been detected not to be<br>available.  |  |  |
|            | <ul> <li>(c) Trigger a fallback to an MRC<br/>where it has not been possible,<br/>feasible and/or safe to re-engage<br/>the fallback user.</li> </ul>               |  |  |

| 5.3.2.2.   | Requirements on ADS feature activation   |  |  |
|------------|--|--|--|
| 5.3.2.2.1. | The ADS shall ensure a safe ADS feature activation.  |  |  |
| 5.3.2.2.2. | The ADS shall provide <b>immediate</b><br><b>prompt</b> feedback to indicate success or<br>failure when the user attempts to enable<br>an ADS feature.   | (OPI) Proposal to replace "prompt" by "immediate".   |  |
| 5.3.2.2.3. | The feature activation process (e.g.,<br>sequence of actions and states) shall<br>take into account relevant<br>recommendations or standards.  |  |  |
| 5.3.2.2.4. | An ADS feature activation resulting in<br>a user becoming a fallback user shall<br>immediately and explicitly inform the<br>fallback user of the consequent<br>expectations on them to be ready to<br>resume the DDT.  | (OPI) An ADS feature activation resulting in a<br>user becoming a fallback user shall immediately<br>and explicitly inform the fallback user to be ready<br>to respond to a request to resume the DDT.   |  |
| 5.3.2.3.   | Requirements on ADS feature deactivation to manual driving   |  |  |
| 5.3.2.3.1. | A system-initiated deactivation in<br>nominal situations shall be indicated in<br>a timely manner to support the fallback<br>user re-engaging to the driving task;<br>Where appropriate, the process (e.g,<br>timing, levels of warnings) may be<br>adapted according to the current<br>circumstances (e.g., the engagement<br>of the fallback user, the status of the<br>ADS and vehicle, the current road<br>traffic situation). | <ul> <li>(OPI)<br/>A system-initiated deactivation in nominal<br/>situations shall be indicated in a timely manner to<br/>support the fallback user re-engaging to the<br/>driving task.</li> <li>(Secy)<br/>Use IWG terminology:</li> <li>"under nominal scenarios", not "in nominal<br/>situations".</li> <li>"in performance of the DDT", not "to<br/>the driving task".</li> <li>Is the justification (to support the fallback<br/>user) necessary)?</li> <li>What does "indicated in a timely manner"<br/>mean? The deactivation is defined as a</li> </ul> |  |

|            |  | <ul> <li>procedure. What is the objective, verifiable requirement?</li> <li>Is the "deactivation procedures" something that should be documented under the Safety Assessment?</li> </ul>  |  |
|------------|--|---|--|
| 5.3.2.3.2. | The ADS shall only allow the user to<br>initiate a system deactivation process if<br>the ADS verifies that the user is in a<br>position to resume the role of the<br>driver. | <ul> <li>(OPI)</li> <li>5.3.2.3.2. Following the user requesting deactivation of the ADS, the ADS shall follow a deactivation process to safely transfer control of the DDT to the user.</li> <li>(Secy) Who is the "user"? How is the safety of the deactivation process that transfers control to the fallback user be covered under the Safety Assessment?</li> </ul>  |  |
|            |  | <ul> <li>5.3.2.3.1.1. The ADS shall only allow respond to the user request to initiate a system deactivation process if the ADS verifies that the user is in a position to assume the role of the driver.</li> <li>(Secy)</li> <li>Terminology: What is a "system deactivation process" in this context? Confusing given terms for "system-initiated" and "user-initiated" deactivations. Should there be a definition for "deactivation process" (define the process as something the ADS does but that can be initiated by the ADS or the user).</li> <li>Is there a difference between "system" and "feature" deactivation (the section uses both)?</li> </ul> | (Secy) Should this be: "The ADS shall only<br>respond to the user request to initiate a system<br>deactivation process if the ADS verifies that the<br>user is in a position to assume the role of the<br>driver." |
|            |  | 5.3.2.3.1.2. ADS feature deactivation may be delayed if it is assessed by the ADS that the situation is unsuitable or unsafe for the subsequent mode of   |  |

|            |   | vehicle operation. In this case, the<br>user shall be informed of this<br>circumstance.  |  |
|------------|---|--|--|
| 5.3.2.3.3. | The ADS shall remain active until the<br>system deactivation process has been<br>completed <b>and the driver is in control</b><br>or the ADS vehicle reaches a minimal<br>risk condition.   | <ul> <li>(OPI) The ADS shall remain active until the system deactivation process has been completed or the ADS vehicle reaches a minimal risk condition.</li> <li>(Secy) The ADS feature shall remain active until the ADS has completed a fallback response.</li> <li>[Justification: "ADS fallback response" means a system-initiated deactivation of the ADS or an ADS-controlled procedure to place the vehicle in a minimal risk condition. The OPI proposal allows for both options, so "fallback response" is technically correct and more concise.]</li> </ul> |  |
| 5.3.2.3.4. | ADS feature deactivation may be<br>delayed if it is assessed by the ADS<br>that the situation is unsuitable or<br><b>unsafe</b> for the subsequent mode of<br>vehicle operation. In this case, the<br><b>user shall be informed of this</b><br><b>circumstance</b> (e.g., due to the current<br>situation being unsuitable or unsafe for<br>the subsequent mode of operation) | (OPI) Propose to delete and replace by para. 5.3.2.3.1.2. above.   |  |
| 5.3.2.3.5. | The user initiated system deactivation<br>process (e.g., sequence of actions and<br>states) shall take into account relevant<br>recommendations or standards.   | (OPI) Delete words.<br>(Secy) This seems to belong under the Safety<br>Assessment requirements. Presumably, the<br>manufacturer demonstrates that<br>"recommendations and standards" were "taken<br>into account" in the design of the "deactivation<br>process" of the ADS.   |  |
| 5.3.2.3.6. | The ADS shall assess the user is suitably engaged to resume the DDT   | (OPI) The ADS shall assess <b>if</b> the user is suitably<br>engaged to resume the DDT before completion of  |  |

|             | before completion of the deactivation process.   | the deactivation process. (with note to "Discuss<br>"engaged" in an interpretation document")<br>(Secy) If the ADS assesses that the "user" is <u>not</u><br>"suitably engaged", it can still complete the<br>deactivation (which is a process). Is the intent to<br>prohibit deactivation if the assessment is<br>negative? Para. 5.3.2.1.5.(a) already requires<br>continuous assessment of whether the fallback<br>user is "available". Para. 5.3.2.3.1.1.: The ADS<br>shall only respond to the user request to initiate a<br>system deactivation process if the ADS verifies<br>that the user is in a position to assume the role of<br>the driver. "Available", "in a position",<br>"engaged", etc. seem roughly the same thing. |
|-------------|--|--|
| 5.3.2.3.7.  | The ADS shall provide a specific indication of the completion of the deactivation of the ADS.  | engaged, etc. seem roughly the same thing.   |
| 5.3.2.3.8.  | At the completion of the deactivation<br>process, control shall be returned to the<br>driver without any continuous lateral or<br>longitudinal control assistance<br>active. <sup>1617</sup> | (OPI) Delete footnote.   |
| 5.3.2.3.9.  | If applicable upon ADS deactivation,<br>the vehicle controls, indicators,<br>warnings, and tell-tales shall be set to<br>an appropriate state for manual driving.                            | (OPI) If applicable, during the deactivation<br>procedure, the vehicle controls, direct vision,<br>devices for indirect vision, indicators, warnings,<br>and tell-tales shall be set to an appropriate state<br>for manual driving.  |
| 5.3.2.3.10. | If applicable, ADS features operating<br>control of closures shall no longer<br>influence closures or the controls<br>associated with closures.  |  |

<sup>&</sup>lt;sup>16</sup> This provision may be changed pursuant to evidence from manufacturers demonstrating assurance of the safety of continuous control assistance pursuant to ADS deactivation.

| 5.3.2.4.   | ADS features that do not allow a user to take manual control of the DDT  |                          |  |
|------------|--|--------------------------|--|
| 5.3.2.4.1. | The ADS shall provide the passenger(s) with means to request to stop the vehicle.  |                          |  |
| 5.3.2.4.2. | The ADS vehicle shall provide safety-<br>related information to the passengers.  |                          |  |
| 5.3.2.4.3. | The ADS shall not initiate motion<br>unless the safety risks to the<br>passenger(s) have been mitigated.   |                          |  |
| 5.3.2.4.4. | The ADS may provide the user(s) with<br>information related to ongoing<br>operations (e.g., destination, upcoming<br>stops, route progress).   | (OPI) Propose to delete. |  |
| 5.3.2.4.5. | Controls provided for manual driving<br>(e.g., steering, service brake, parking<br>brake, accelerator, lighting) shall be<br>designed to prevent any effect on the<br>DDT whilst the ADS is performing the<br>DDT, or reasonable safeguards shall be<br>put in place to prevent access to<br>controls. |                          |  |

| 5.4.   | Safety Assessment   | Safety Case  |        |
|--------|---|--|--------|
| 5.4.1. | ADS general description                                     | <ul> <li>(OPI)</li> <li>The manufacturer shall provide a safety case that affirms and provides evidence to demonstrate that the ADS meets the requirements in [Requirements section] and is free from unreasonable risks for the ADS vehicle user(s) and other road users. This shall include the safety concept, which describes the intended use, the operating environment, the interactions with humans, sub-systems and components, control strategies, hazard identification and mitigation measures designed into the ADS to meet the requirements of this regulation and achieve the goal of avoidance of unreasonable risk with regard to functional and operational safety. The safety case shall be in the form of structured argumentation supported by evidence, including validation tests. The safety case shall also include the demonstration of credibility and suitability of test tools used in generating evidence and the processes for reinforcing ADS safety throughout the life of the system.</li> <li>(Secy) Suggest breaking this provision into a main statement followed by subparagraphs and moving the whole into the general requirements (Section 4 intended to provide an overview of the regulation).</li> </ul> |        |
|        | The manufacturer shall establish a safety case for the ADS. |  |        |
|        |   | 5.4.2. Safety Concept  |        |
|        |   | 5.4.2.1. The requirements in this section shall apply to the ADS system as a whole   |        |
| 5.4.3. | ADS Layout and Schematics                                   | 5.4.2.1.1 Systems, sub-systems & components  | (Secy) |

|   |   | Deep numbering and style not consistent with rest of regulation. Reconsider. |
|---|---|--|
|   | The manufacturer shall provide documentation<br>listing the components in the ADS and their link<br>to the function of each ADS feature which shall<br>include: [a, b, c] |  |
| <ul> <li>(a) Inventory of components</li> <li>A list shall be provided, including all the units of the ADS and mentioning the other vehicle systems which are needed to achieve the control function in question. An outline schematic showing these units and their relationships shall be provided, with both the equipment distribution and the interconnections made clear. The outline shall include:</li> </ul> | (Secy) Numbered para: Significant requirement<br>rather than a list item  |  |
| (i) Perception and objects<br>detection including mapping<br>and positioning  |   |  |
| (ii) Characterization of decision-<br>making  |   |  |
| (iii) Remote supervision and<br>remote monitoring by a<br>remote supervision centre (if<br>applicable)  | (Secy)<br>Undefined "remote" terms/concepts.  |  |
| (iv) Information display/user<br>interface  |   |  |
| (v) The data storage system<br>(e.g., DSSAD).   | (Secy)<br>Inform EDR/DSSAD IWG.   |  |

| <ul> <li>(b) Functions of the units</li> <li>The function of each unit of the ADS shall be outlined and the signals linking it with other units or with other vehicle systems shall be shown. This may be provided by a labelled block diagram or other schematic, or by a description aided by such a diagram. Interconnections within the ADS shall be shown by a circuit diagram for the electric transmission links, by a piping diagram for pneumatic or hydraulic transmission equipment and by a simplified diagrammatic layout for mechanical linkages. The transmission links both to and from other systems shall also be shown. There shall be a clear correspondence between transmission links and the signals carried between units. Priorities of signals on multiplexed data paths shall be stated wherever priority may be an</li> </ul> | (Secy) Numbered para: Significant requirement<br>rather than a list item. |  |
|---|---|--|
| issue affecting performance or safety.(c) Identification of unitsEach unit shall be clearly and<br>unambiguously identifiable (e.g.<br>by marking for hardware, and by<br>marking or software identification<br>  | (Secy) Numbered para: Significant requirement rather than a list item.    |  |

|          | software identification must be<br>updated by means of the newly<br>released software. Where<br>functions are combined within a<br>single control unit or indeed<br>within a single computer, but<br>shown in multiple blocks in the<br>diagram, then for clarity and ease<br>of explanation, only a single<br>hardware identification marking<br>shall be used. The identification<br>defines the hardware and software<br>version and, where the software<br>changes and alters the function of<br>the unit, the identifier associated<br>with that software shall also be<br>changed. |   |  |
|----------|--|---|--|
| 5.4.2.1. | A description shall be provided which<br>gives a clear explanation of all the<br>functions including control strategies of<br>the ADS and the methods employed to<br>perform the dynamic driving tasks<br>within the ODD and the boundaries<br>under which the ADS is designed to<br>operate, including a statement of the<br>mechanism(s) by which control is<br>exercised  | A description of the physical capabilities of the system shall be provided. This shall include: |  |
|          | <ul> <li>(d) Installation of sensing system components</li> <li>The manufacturer shall provide information regarding the installation options that will be employed for the individual components that comprise the sensing system. These options shall include, but are not limited to, the location of the component in/on the</li> </ul>  | (a) Installation of sensing system  |  |

| vehicle, the material(s) surrounding the<br>component, the dimensioning and<br>geometry of the material surrounding<br>the component, and the surface finish<br>of the materials surrounding the<br>component, once installed in the<br>vehicle. The information shall also<br>include installation specifications that<br>are critical to the ADS's performance,<br>e.g., tolerances on installation angle.<br>Any changes to the individual<br>components of the sensing system, or<br>the installation options, shall be<br>updated in the documentation. |   |  |

|-----|---|--|

| 5.4.4.   | Safety Concept and Validation of the Safety Concept by the Manufacturer  |  |  |
|----------|--|--|--|
| 5.4.4.1. | The manufacturer shall provide a safety<br>case that affirms and provides evidence<br>to demonstrate that the ADS is free<br>from unreasonable risks for the ADS<br>vehicle user(s) and other road users.<br>This shall include the safety concept,<br>which describes measures designed<br>into the ADS to achieve the goal of<br>avoidance of unreasonable risk with<br>regard to functional and operational<br>safety. The safety case shall also<br>includes a structured demonstration<br>supported by evidence, including<br>validation tests, that the ADS will be<br>free from unreasonable risk. In respect<br>of software employed in the ADS, the<br>outline architecture shall be explained<br>and the design methods and tools used<br>shall be identified. The manufacturer<br>shall show evidence of how the ADS<br>capabilities were realized and checked<br>during the design and development<br>process. | (Secy) Related to comment at <u>6.2.1.6.</u> |  |

| If a chosen provision utilizes a partial    |  |
|---|--|
| performance mode of operation under         |  |
| certain fault conditions (e.g. in case of   |  |
| severe failures), then these conditions     |  |
| shall be stated (e.g. type of failure). The |  |
| resulting ADS behaviour and                 |  |
| capabilities shall be defined (e.g.         |  |
| achievement of a minimal risk               |  |
| condition immediately) as well as the       |  |
| warning strategy to the driver/remote       |  |
| supervision centre (if applicable). If the  |  |
| chosen provision selects a second           |  |
| (back-up) means to realize the              |  |
| performance of the dynamic driving          |  |
| task, the principles of the change-over     |  |
| mechanism, the logic and level of           |  |
| redundancy and any built-in back-up         |  |
| checking features shall be explained        |  |
| and the resulting limits of back-up         |  |
| effectiveness defined. If the chosen        |  |
| provision selects the removal of an         |  |
| automated driving function, it shall be     |  |
| done in compliance with the relevant        |  |
| provisions of this regulation. In this      |  |
| case, all the corresponding output          |  |
| control signals associated with this        |  |
| function shall also be inhibited.           |  |

| 5.4.4.3. The documentation shall be supported<br>by an analysis which shows how the<br>ADS will behave to mitigate or avoid<br>hazards which can have a bearing on<br>the safety of the ADS vehicle user(s)<br>and other road users. It shall show how<br>unknown hazardous scenarios will be<br>managed by the manufacturer to keep<br>the residual risk level under control.<br>The chosen analytical approach(es)<br>shall be established by the<br>manufacturer and made available for<br>assessment to the relevant authority<br>before market introduction. | by an analys<br>ADS will be<br>hazards whi<br>the safety of<br>and other ro<br>unknown ha<br>managed by<br>the residual<br>The chosen<br>shall be esta<br>manufacture<br>assessment | .4.4.3. |
|---|---|---------|
|---|---|---------|

| 5.4.4.4. | The auditor shall perform an assessment of the application of these analytical approaches, including: | Open issue: Differentiate and separate<br>manufacturer requirements from provisions on<br>conducting the assessment of the manufacturer's<br>safety case. |
|----------|---|---|
|          | (a) Inspection of the safety approach at the concept (vehicle) level;                                 |   |
|          | (b) This approach shall be based on a<br>Hazard/Risk analysis appropriate<br>to system safety;        |   |

| (c) | The safety assessment approach<br>shall include a top- down (from<br>possible hazard to design) and<br>bottom-up approach (from design<br>to possible hazards). The safety<br>assessment may be based on a<br>Failure Mode and Effect Analysis<br>(FMEA), a Fault Tree Analysis<br>(FTA), a System-Theoretic<br>Process Analysis (STPA) or any<br>similar process appropriate to<br>system functional and operational<br>safety provided the<br>appropriateness of this process is<br>demonstrated. | ADS-03: Agreement on text except for open<br>issue: Is "…provided the appropriateness of this<br>process is demonstrated" necessary? |  |
|-----|---|--|--|
|-----|---|--|--|

| 5.4.4.5. | The documentation shall demonstrate<br>that at least the following items have<br>been covered where applicable:  |  |
|----------|--|--|
|          | <ul><li>(a) Issues linked to interactions with<br/>other vehicle systems (e.g.,<br/>braking, steering)</li></ul>   |  |
|          | <ul> <li>(b) Failures of the automated driving<br/>system and the resulting risk<br/>mitigation strategy;</li> </ul>   |  |
|          | <ul> <li>(c) Situations within the ODD when a system may create unreasonable safety risks to the ADS vehicle user(s) and other road users due to operational disturbances, for instance: <ul> <li>(i) Lack of or wrong comprehension of the vehicle environment;</li> <li>(ii) Lack of understanding of the reaction from the driver the ADS vehicle user(s) or other road users;</li> <li>(iii) Inadequate control;</li> <li>(iv) Challenging scenarios;</li> </ul></li></ul> |  |
|          | <ul> <li>(d) Identification of the relevant<br/>scenarios within the ODD<br/>boundaries and the methodology<br/>used to select scenarios and<br/>choose the validation<br/>methodology and approach;</li> </ul>  |  |
|          | <ul> <li>(e) Decision-making process for the<br/>performance of the dynamic<br/>driving tasks (e.g. emergency<br/>manoeuvres), the interaction with<br/>other road users and the<br/>compliance with traffic rules;</li> </ul>   |  |

| (   | (f) Cyber-attacks that may have an impact on the safety of the vehicle;   |  |
|---|---|--|
|   | (g) Reasonably foreseeable misuse by<br>the driver (if applicable) (e.g., the<br>use of a driver availability<br>recognition system and an<br>explanation on how the<br>availability criteria were<br>established), mistakes or<br>misunderstanding by the driver if<br>applicable (e.g., unintentional<br>override) and intentional<br>tampering of the ADS.   |  |
| a<br>in<br>tl<br>c<br>A<br>d<br>a<br>a<br>(-<br>s<br>s<br>n | The safety case shall include arguments<br>and evidence supporting the<br>mplementation of the safety concept<br>that is understandable and logical and<br>cover all the different functions of the<br>ADS. The documentation shall also<br>demonstrate that validation measures<br>are robust enough to demonstrate safety<br>(e.g., reasonable coverage of chosen<br>scenarios as part of the validation<br>methodology chosen) and have been<br>completed. |  |

| 5.4.4.7. | The documentation shall provide<br>evidence that the vehicle is free from<br>unreasonable risks to the ADS vehicle<br>user(s) and other road users in the<br>operational design domain. This may<br>be achieved through:  | OPI: This may shall be achieved through:                | Stopped here for SA. |
|----------|---|---|----------------------|
|          | <ul> <li>(a) Overall validation targets (i.e., validation acceptance criteria) supported by validation results demonstrating that entry into service of the ADS will not increase the overall level of risk to the ADS vehicle user(s) and other road users compared to manually driven vehicles within the ODD; and</li> </ul> | OPI: manually driven vehicles within the ODD;<br>and/or |                      |
|          | (b) A scenario-specific approach<br>showing that the ADS will not<br>increase the overall level of risk<br>to the ADS vehicle user(s) and<br>other road users compared to a<br>manually driven vehicles within<br>the ODD for each of the safety<br>relevant scenarios.   |   |                      |

| 5.4.4.8. | The safety case shall provide<br>documentation sufficient to allow the<br>relevant authority to verify through<br>assessment of the case and possible<br>testing by the authority that the<br>manufacturer has successfully<br>implemented the safety concept<br>applicable to the ADS. The<br>documentation shall itemizes the<br>parameters being monitored on the<br>vehicle and shall set out evidence<br>supporting the argument that applicable<br>safety requirements have been met.<br>This documentation shall also describe<br>the measures in place to ensure the<br>ADS is free from unreasonable risks to<br>the ADS user(s) and other road users<br>when the performance of the ADS is<br>affected by environmental conditions<br>(e.g., climatic, temperature, dust<br>ingress, water ingress, ice packing). |  |  |
|----------|---|--|--|
| 5.4.4.9. | Information Provision to Users (as appropriate: owners, users, operators, etc.)   | OPI: Propose to move provision to "User safety" section.   |  |
|          | For the ADS users, documentation shall<br>be provided that facilitates user<br>understanding of the functionality and<br>operation of the system covering at<br>least:  | OPI: For the ADS users, documentation <b>and</b><br><b>delivery</b> should shall be provided that facilitates<br>to the users to facilitate user understanding<br>of |  |
|          | <ul> <li>(a) An operational description of the<br/>ADS features, capabilities, and<br/>limitations (the information<br/>should also refer to specific<br/>scenarios and/or ODD);</li> </ul>   |  |  |

| (o) Data protection and data security functionalities.   |  |  |
| NEW  | <ol> <li>Credibility Framework Requirements</li> <li>(Secy) Since the safety case involves supporting evidence that may have been generated by the manufacturer's virtual testing, would it make sense for these requirements to be part of the safety case requirements? If the safety case relies on virtual testing, then the manufacturer must prove that the outcomes of this testing are credible</li> <li>(Secy) Deep numbering: reconsider headers/structure.</li> </ol> |  |
|  | 1.1. The manufacturer shall describe the intended use(s) of virtual testing and its role in the overall testing strategy.  |  |
|  | 1.2 The manufacturer shall demonstrate that<br>the simulation toolchain(s) is suitable to<br>use for virtual testing by demonstrating<br>compliance with the requirement listed<br>in this section.  |  |
|  | 1.2.1. The manufacturer shall document the capability of the simulation toolchain and explain their claim that it is suitable to undertake the virtual testing.  |  |

| 1.2.2. The manufacturer shall document the activities and processes that support the claim that the simulation toolchain is suitable to use for virtual testing.   |  |
|--|--|
| 1.2.3. The manufacturer shall provide evidence<br>that supports their claim that the<br>simulation toolchain is suitable to use<br>for virtual testing.  |  |
| 1.2. The manufacturer shall demonstrate that<br>the simulation toolchain(s) is suitable to<br>use for virtual testing by:  |  |
| <ul> <li>(a) Performing a criticality analysis<br/>that evaluates the potential risk and<br/>consequences of using the<br/>simulation toolchain(s) for the<br/>assessment of the ADS safety case<br/>and functional/user requirements</li> </ul>             |  |
| <ul> <li>(b) Demonstrating that the simulation<br/>toolchain(s) fulfils the credibility<br/>requirements corresponding to the<br/>identified criticality as per the<br/>requirements listed in this section.</li> </ul>                                      |  |
| 1.3. Simulation Toolchain Management requirements  |  |
| 1.3.1. Simulation Toolchain Data Management requirements   |  |
| 1.3.1.1. The manufacturer shall manage the data<br>used to develop, verify, validate and<br>update the simulation toolchain(s)<br>throughout its lifetime. The<br>manufacturer shall consider the<br>completeness, accuracy and consistency<br>of this data. |  |

| 1.3.1.2. The manufacturer shall maintain a record of the data used in the validation of the toolchain.   |  |
|--|--|
| 1.3.1.3. If the simulation toolchain(s)<br>incorporates or relies upon data/tools<br>from other organizations which are not<br>under the control of the manufacturer,<br>the manufacturer shall demonstrate the<br>measures taken to manage the quality<br>and integrity of that data/tools. |  |
| 1.3.1.4. With regards to input data management<br>and parameters associated with the<br>simulation toolchain(s), the<br>manufacturer shall:  |  |
| <ul> <li>(a) document the data used to develop,<br/>verify and validate the simulation<br/>toolchain(s) and note important<br/>quality characteristics</li> </ul>  |  |
| <ul> <li>(b) provide documentation showing<br/>that the data used to develop, verify<br/>and validate the simulation<br/>toolchain(s) covers the intended<br/>functionalities that the virtual<br/>testing aims to assess</li> </ul>   |  |
| (c) document the data and the<br>calibration procedures employed to<br>fit any parameters associated with<br>the simulation toolchain  |  |
| <ul> <li>(d) explain the reasons for data or<br/>parameters changing between<br/>releases.</li> </ul>  |  |
| 1.3.1.5. The manufacturer shall quantify the uncertainty in the simulation toolchain(s) and its outputs that occur because of the quality of the data (e.g.  |  |

| data coverage, signal to noise ratio, and sensors' uncertainty/bias/sampling rate).   |  |
|---|--|
| 1.3.1.6. With regards to the data that is produced<br>by the simulation toolchain(s) and its<br>components, the manufacturer shall:   |  |
| <ul> <li>(a) maintain a record of the output<br/>from the simulation toolchain(s)<br/>during its validation and ensure<br/>that they are traceable to the input<br/>data that produced them.</li> </ul> |  |
| <ul> <li>(b) document the output data and note<br/>any important quality<br/>characteristics that can be deduced<br/>from analysis of the data, e.g.<br/>applying statistical methodologies.</li> </ul> |  |
| 1.3.1.7. With regards to the quality of the data that is produced by the simulation toolchain(s) and its components, the manufacturer shall:  |  |
| (a) ensure it is sufficient to undertake any validation activity;   |  |
| (b) ensure it is sufficient to allow<br>consistency/sanity check of the<br>simulation toolchain, possibly by<br>exploiting redundant information;   |  |
| (c) ensure it is sufficient to justify manufacturer's claims about their safety case.   |  |
| 1.3.1.8. With regards to the management of stochastic models, the manufacturer shall:   |  |
| (a) characterize the variance in the simulation toolchain(s)'s output;  |  |

| (b) ensure the possibility of a deterministic<br>re-execution of the simulation toolchain.  |  |
|---|--|
| 1.3.2. Simulation Competency requirements   |  |
| 1.3.2.1. The manufacturer shall document and<br>provide the rationale for their confidence<br>in the competency of:   |  |
| <ul> <li>(a) the personnel that developed the simulation toolchain(s) and its components;</li> </ul>  |  |
| (b) the personnel that assessed the<br>simulation toolchain(s) and its<br>components;   |  |
| (c) the personnel that used the simulation<br>toolchain(s) to perform the testing with<br>the purpose of validating the system.   |  |
| 1.3.2.2. The manufacturer shall have processes<br>and procedures that identify and<br>maintain the skills, knowledge, and<br>experience needed to perform the<br>various activities. The following<br>processes shall be established,<br>maintained and documented. |  |
| <ul> <li>(a) Process to identify and evaluate the necessary competencies that are required to perform the modelling and simulation activities</li> </ul>  |  |
| (b) Process for training personnel to be<br>competent to perform the modelling and<br>simulation activities.  |  |
| 1.3.2.3. The manufacturer shall maintain records<br>of the personnel in the various teams<br>showing they have received the<br>necessary training and have been<br>deemed competent to perform the  |  |

| modelling and simulation activities assigned to those personnel.   |  |
|--|--|
| 1.3.2.4. The manufacturer shall set up suitable<br>arrangements with third-party<br>organisations to ensure that the<br>competency of their personnel is<br>adequate to demonstrate the credibility<br>of the simulation toolchain(s). |  |
| 1.3.2.5. [NEW: Placeholder to ref SMS in case<br>of third-party data/tools providers]  |  |
| 1.3.3. Simulation Toolchain Release<br>Management requirements   |  |
| <ul> <li>1.3.3.1. The manufacturer shall manage and support the simulation toolchain(s) used for virtual testing throughout its complete lifecycle.</li> <li>(Secy) Undefined term "lifecycle". What does "its" refer to?</li> </ul>   |  |
| 1.3.3.2. The manufacturer shall manage and<br>document the simulation toolchain(s)<br>release process. The simulation<br>toolchain(s) release management activity<br>shall include:  |  |
| (a) a description of the modifications<br>associated with each toolchain(s) release  |  |
| (b) a record of any associated software (e.g.,<br>specific software product, designations<br>and version) and hardware arrangements<br>(e.g., XiL configuration)   |  |
| (c) a record of the internal review activities<br>that supported the toolchain(s)<br>acceptance and release.   |  |
| 1.4. Simulation Toolchain requirements   |  |

| 1.4.1. The manufacturer shall describe the simulation toolchain(s) and identify its scope of applicability, its limitations, assumptions and the sources of uncertainty that can affect results.                      |  |
|---|--|
| 1.4.1.1. Description of the Simulation Toolchain  |  |
| 1.4.1.1.1. The manufacturer shall provide a description of the simulation toolchain(s) and its components.  |  |
| 1.4.1.1.2. The manufacturer shall provide a description of the approach adopted in the simulation toolchain(s) validation.  |  |
| 1.4.1.1.3. The manufacturer shall provide a description of the acceptance tests and criteria that will be used to determine if the simulation toolchain(s) is considered credible based on the credibility framework. |  |
| 1.4.1.2. Simulation Toolchain Assumptions,<br>known Limitations, and Uncertainty<br>Quantification  |  |
| 1.4.1.2.1. The manufacturer shall describe the<br>modelling assumptions and<br>considerations that which guided the<br>design of the toolchain.   |  |
| 1.4.1.2.2. The manufacturer shall provide information on:   |  |
| <ul> <li>(a) any assumptions made during the development of the simulation toolchain(s) and its components and the limitations that this places on its scope and applicability</li> </ul>                             |  |

| (b)        | the rationale for choices made about<br>the level of fidelity of the simulation<br>toolchain(s) and its components.   |  |
|------------|---|--|
| 1.4.1.2.3. | The manufacturer shall provide<br>justification that the tolerances<br>associated with the simulation<br>toolchain(s) are appropriate and meet<br>the acceptance tests and criteria.                                  |  |
| 1.4.1.2.4. | The manufacturer shall provide details<br>of the sources of uncertainty in the<br>simulation toolchain(s) and its<br>components and an assessment of their<br>impact on the results.                                  |  |
| 1.4.1.3.   | Simulation Toolchain scope.   |  |
| 1.4.1.3.1. | The manufacturer shall document the<br>scope of the simulation toolchain(s)<br>and identify its limitations. It should<br>refer to the ODD and identify any<br>limitations about its applicability<br>within the ODD. |  |
| 1.4.1.3.2. | The manufacturer shall demonstrate<br>how the simulation toolchain(s)<br>imitates the relevant physical<br>phenomena and meets the necessary<br>level of accuracy.  |  |
| 1.4.1.3.3. | The manufacturer shall demonstrate<br>that the test selection for simulation<br>toolchain(s) validation is sufficient to<br>demonstrate that it will perform<br>effectively within the defined scope.                 |  |
| 1.4.1.3.4. | The manufacturer shall provide a list<br>of tests used for validation and the<br>corresponding parameters and any<br>known limitation.  |  |

| 1.4.1.4.   | Simulation Toolchain Criticality   |  |
|------------|--|--|
|            | analysis.  |  |
| 1.4.1.4.1. | The manufacturer shall review the<br>simulation toolchain(s) to assess the<br>criticality of prediction errors and the<br>effect these would have on the<br>manufacturer's claims about their<br>safety case.  |  |
| 1.5.       | Simulation Toolchain Verification requirements   |  |
| 1.5.1.     | The manufacturer shall demonstrate<br>that the simulation toolchain(s) will<br>not exhibit unrealistic behaviour for<br>valid inputs which have not been<br>explicitly tested.   |  |
| 1.5.2.     | Simulation Toolchain Code<br>Verification requirements   |  |
| 1.5.2.1.   | The manufacturer shall document the<br>execution of proper code verification<br>techniques, used in evaluating the<br>simulation toolchain(s) and its<br>components, e.g. static/dynamic code<br>verification, convergence analysis and<br>comparison with exact solutions if<br>applicable. |  |
| 1.5.2.2.   | The manufacturer shall provide<br>evidence that the input parameter<br>space was sufficiently explored to<br>identify if there are any parameter<br>combinations for which the simulation<br>toolchain(s) shows unstable or<br>unrealistic behaviour.  |  |
| 1.5.2.3.   | The manufacturer shall provide<br>information on any sanity/consistency<br>checking procedures that are used.  |  |

| 1.5.3.   | Simulation Toolchain Calculation<br>Verification requirements  |  |
|----------|--|--|
| 1.5.3.1. | The manufacturer shall document<br>numerical error estimates (e.g.<br>discretization error, rounding error,<br>iterative procedures, and convergence).   |  |
| 1.5.3.2. | The manufacturer shall review their<br>analysis and demonstrate that the<br>numerical errors are understood and<br>sufficiently bounded to allow the<br>simulation toolchain(s) to be used for<br>virtual testing.   |  |
| 1.5.4.   | Simulation Toolchain Sensitivity<br>Analysis requirements  |  |
| 1.5.4.1. | The manufacturer shall provide<br>documentation demonstrating that the<br>input data and parameters that most<br>critically influence the toolchain(s)<br>outputs have been identified by means<br>of appropriate sensitivity analysis<br>techniques.                    |  |
| 1.5.4.2. | The manufacturer shall demonstrate<br>that robust calibration procedures have<br>been adopted for assigning appropriate<br>value(s) to the most critical parameters<br>to ensure that the simulation toolchain<br>imitates the physical system.                          |  |
| 1.5.4.3. | The manufacturer shall demonstrate<br>that sensitivity analysis has been used<br>to identify the critical input data and<br>parameters that needs particular<br>attention in order to characterize the<br>uncertainty of the overall simulation<br>toolchain(s) outputs. |  |

| r      |   |  |
|--------|---|--|
| 1.6.   | Simulation Toolchain Validation requirements  |  |
| 1.6.1. | The manufacturer shall quantitatively<br>determine the degree to which the<br>simulation toolchain(s) is an accurate<br>representation of the real-world system<br>by means of a validation analysis.     |  |
| 1.6.2. | The manufacturer shall provide<br>evidence that the simulation<br>toolchain(s) results are consistent and<br>correlated with the results of the<br>physical tests.  |  |
| 1.6.3. | The validation shall be performed on a sufficiently representative set of tests in order to substantiate the claims about the capability of the simulation toolchain(s) within its scope.                 |  |
| 1.6.4. | The manufacturer shall define the<br>measures of performance (metrics) that<br>will be used when comparing between<br>the results of physical tests and the<br>output of the simulation toolchain(s).     |  |
| 1.6.5. | The manufacturer shall use appropriate<br>statistical techniques when comparing<br>the results of the physical tests and the<br>output of the simulation toolchain(s)<br>and its components.              |  |
| 1.6.6. | The manufacturer shall specify<br>acceptance tests and criteria during the<br>simulation toolchain(s) and its<br>components development activity and<br>will demonstrate that they have been<br>achieved. |  |
| 1.6.7. | The manufacturer shall define the methodology and the tests used for the  |  |

|          | simulation toolchain(s) validation. It<br>should be clear whether the full ODD<br>is within scope of the toolchain or only<br>part of it.   |  |
|----------|---|--|
| 1.6.7.1. | The validation strategy may consist of one or more of the following:  |  |
| (a)      | subsystem model validation e.g.<br>environment models, sensor models,<br>and vehicle models   |  |
| (b)      | vehicle system model validation<br>(vehicle dynamics model together with<br>the environment model)  |  |
| (c)      | sensor system validation (sensor model together with the environment model)   |  |
| (d)      | integrated system validation (sensor<br>model together with the environment<br>model with influences form vehicle<br>model).  |  |
| 1.6.8.   | The manufacturer shall demonstrate<br>that the accuracy criteria defined<br>during the simulation toolchain(s)<br>development have been met.  |  |
| 1.6.9.   | The manufacturer shall provide<br>evidence that the processes related to<br>the validation activity have been<br>followed.  |  |
| 1.6.10.  | The manufacturer shall document their<br>uncertainty characterisation analysis<br>and provide information about how the<br>simulation toolchain(s) should be used<br>and any safety margins that should be<br>applied when it is used for virtual<br>testing. |  |

| 1.6.11. | The manufacturer shall demonstrate<br>they have techniques to estimate the<br>simulation toolchain(s)'s critical<br>inputs.  |  |
|---------|--|--|
| 1.6.12. | The manufacturer shall demonstrate<br>that they have characterised the critical<br>parameters used in the simulation<br>toolchain(s) and its components and<br>where appropriate have identified<br>these as distributions with confidence<br>intervals. |  |
| 1.6.13. | The manufacturer shall provide<br>evidence that a proper characterization<br>of the uncertainty of the results of the<br>simulation toolchain(s) and its<br>components, because of any<br>assumptions therein, has been made.                            |  |
| 1.6.14. | The manufacturer shall demonstrate<br>the that they have differentiated<br>between the aleatory and epistemic<br>uncertainties associated with the<br>simulation toolchain(s).   |  |

| 5.5.     | Cybersecurity and software updates management  |                  |  |
|----------|--|------------------|--|
| 5.6.     | Data storage system  |                  |  |
| 5.7.     | In service monitoring and reporting  |                  |  |
| 5.7.1.   | ISMR processes   | (OPI)            |  |
| 5.7.1.1. | Before the deployment of the ADS, the<br>manufacturer shall establish processes to<br>demonstrate its capabilities to execute an<br>effective ISMR.  | Transfer to SMS. |  |
| 5.7.1.2. | The ISMR processes shall be part of the SMS of the manufacturer.   |                  |  |
| 5.7.1.3. | <ul> <li>The processes for ISMR shall demonstrate the capabilities:</li> <li>(a) To monitor critical and non-critical occurrences caused by the ADS.</li> <li>(b) To manage potential safety-relevant gaps during the in-service operation phase and to update the ADS accordingly.</li> <li>(c) To perform event investigation.</li> <li>(d) To report safety-relevant occurrences to the relevant authority when they occur.</li> <li>(e) To confirm the compliance with the defined safety case.</li> <li>(f) To share learnings derived from incidents and near-miss analysis.</li> <li>(g) To contribute to the continuous improvement of automotive safety.</li> </ul> |                  |  |
| 5.7.1.4. | The manufacturer shall define appropriate<br>key performance indicators (KPI) to<br>measure the effectiveness of ISMR<br>activities for the ADS operations.  |                  |  |

| 5.7.2.     | In-service monitoring  | (All proposa<br>indicated) | als from OPI unless otherwise   |  |
|------------|--|----------------------------|---|--|
| 5.7.2.1.   | The manufacturer and (where applicable)<br>the fleet operator shall set up a monitoring<br>program aimed at collecting and analysing<br>vehicle data, and data from other sources.   | 5.7.2.1                    | The manufacturer shall monitor the performance of all its in-service ADS vehicles.  |  |
| 5.7.2.2.   | The manufacturer shall provide evidence<br>of the in-service safety performance of the<br>ADS and confirmatory evidence of the<br>audit results of the Safety Management<br>System requirements established by the<br>Audit Pillar. (Note: The in-service<br>monitoring is intended to be applicable to<br>all individual ADS types, not to a subset<br>selected by the manufacturer or where<br>applicable, by the fleet operator). | 5.7.2.2.                   | The manufacturer shall collect and<br>analyse vehicle data, and data from<br>other sources to achieve the ISMR<br>objectives.   |  |
| 5.7.2.2.   | The monitoring program shall include a data acquisition strategy, data retention strategy, data access, security and protection policy.  | 5.7.2.3.                   | The manufacturer shall have a data<br>acquisition strategy, data retention<br>strategy, data access, and security<br>and protection policy.                                       |  |
| 5.7.2.2.1. | The data acquisition strategy shall ensure<br>a representative collection of data to<br>monitor the ADS in service performance.  | 5.7.2.3.1.                 |   |  |
| 5.7.2.2.2. | The retention strategy shall ensure that the dataset is retained until the corrective action and review processes are complete.  | 5.7.2.3.2.                 | The retention strategy shall ensure<br>that data related to a detected<br>safety issue is retained until any<br>necessary corrective action and<br>review processes are complete. |  |
|            | In addition, the strategy shall ensure the<br>retention of the data for longer-term trend<br>analysis (i.e. subset of the collected data).   | 5.7.2.3.2.1.               | In addition, the strategy shall<br>ensure the retention of the data for<br>longer-term trend analysis (i.e.<br>subset of the collected data).                                     |  |
| 5.7.2.2.3. | The data access, security and protection<br>policies shall ensure that information<br>access is allowed only to authorised   | 5.7.2.3.3.                 | The data access, security and<br>protection policies shall ensure that<br>information access is allowed only  |  |

|          | persons and contains safeguards to ensure<br>the security and protection of the data.  | to authorized persons and contains<br>safeguards to ensure the security<br>and protection of the data in<br>accordance with the data-<br>protection laws of the relevant<br>jurisdiction.<br>(Secy) "relevant jurisdiction" is ambiguous.  |  |
|----------|--|--|--|
| 5.7.2.3. | The data monitoring program shall allow<br>the manufacturer <del>and (where applicable)</del><br>the fleet operator to:  | 5.7.2.4. The manufacturer shall achieve the following objectives from the monitoring activity:   |  |
|          |  | <ul> <li>(a) Verify the safety performance         <ul> <li>(i.e., Safety Performance</li> <li>Indicators) and confirm the</li> <li>in-service safety level of the</li> <li>system (i.e. metrics and</li> <li>thresholds).</li> </ul> </li> </ul>  |  |
|          | <ul> <li>(a) Identify areas of operational risk and<br/>quantify current safety margins (e.g.<br/>in service safety performance<br/>monitoring safety performance<br/>indicator).</li> </ul> | (b) Identify areas of operational risk.  |  |
|          | <ul> <li>(b) Identify when the ADS prevents<br/>incidents/accidents (e.g., MRC<br/>fallbacks, collision avoidance,<br/>emergency manoeuvres).</li> </ul>                                     | (c) Identify when the ADS<br>prevents incidents/accidents<br>(e.g., MRC fallbacks,<br>collision avoidance,<br>emergency manoeuvres).   |  |
|          |  | <ul> <li>(Secy)</li> <li>IWG stated preference to avoid the use of "e.g."</li> <li>examples.</li> <li>Word choice: "Prevent" means "to stop from<br/>happening". The list includes response to<br/>incidents that occur. FRAV concept was to<br/>manage critical situations and failures.</li> </ul> |  |

| (c             | ) Identify and quantify operational<br>risks by collecting data to<br>characterize and analyse<br>occurrences.   |   | Characterize and analyse<br>accurrences.  |  |
|----------------|--|---|---|--|
| (d             | ) Use metrics and thresholds to assess<br>safety risks and discover trends that<br>suggest the emergence of<br>unacceptable risks if that trend<br>continues.                                      | tl  | Discover trends that suggest<br>he emergence of<br>nacceptable risks.   |  |
| (e             | ) Put in place procedures for remedial action when an unacceptable risk is discovered or predicted by trends.  | a<br>u<br>d                                       | Ensure that remedial actions<br>re put in place when an<br>inacceptable risk is<br>liscovered or predicted by<br>rends.                       |  |
|                |  | (Secy)<br>Non-sequitur? Moni<br>from managing rem | itoring is a different activity edial actions.  |  |
| (f             | Confirm the in-service safety level<br>and effectiveness of any remedial<br>action.  |   | Confirm the effectiveness of ny remedial action.  |  |
|                |  | n<br>Si   | Enabling the development of<br>new or the revision existing<br>cenarios derived from ISMR<br>ctivities.                                       |  |
| th<br>su<br>ac | the data monitoring program shall ensure<br>at the data analysis is performed with<br>fficient frequency so that remedial<br>tion can be taken promptly and in line<br>ith reporting requirements. | data ar<br>freque<br>can be                       | anufacturer shall perform a<br>halysis with sufficient<br>ncy so that remedial action<br>taken promptly and in line<br>eporting requirements. |  |
|                | ne analysis techniques shall comprise the llowing:   |   | alysis techniques shall<br>e at least the following:  |  |
| (a             | ) Routine measurements: a selection of parameters shall be collected to characterise each trip and to allow a  | S   | Routine measurements: a<br>election of parameters shall<br>be collected to characterize   |  |

| comparative analysis. These<br>measurements shall aim at<br>identifying and monitoring emerging<br>trends and tendencies before the<br>trigger levels associated with<br>exceedances are reached. (e.g.<br>vehicle performance monitoring).   | the performance of ADS and<br>to allow a comparative<br>analysis. These<br>measurements shall aim at<br>identifying and monitoring<br>emerging trends and<br>tendencies before the trigger<br>levels associated with<br>exceedances are reached.   |  |
|---|--|--|
| <ul> <li>(b) Exceedance detection: a set of core<br/>"value" shall be selected to cover the<br/>main areas of interest for the ADS<br/>operation with aim at searching for<br/>deviations from vehicle safety<br/>performance and limits. Typically,<br/>the main areas of interest are derived<br/>from the assessment of the most<br/>significant risks before the market<br/>introduction. However, they shall be<br/>continuously reviewed to reflect the<br/>current operations. (e.g., speed limits<br/>exceedance, near misses, harsh<br/>braking, etc.).</li> </ul> | (b) Exceedance detection: a set<br>of core" value" shall be<br>selected to cover the main<br>areas of interest for the ADS<br>operation with aim at<br>searching for deviations from<br>safety performance and<br>limits. They shall be<br>continuously reviewed to<br>reflect the current operations. |  |

X.x)<br/>using the recorded data.</li> </ul>  |  |
| <ul> <li>(d) Statistics: Data Series shall be collected to support the analysis process with additional information. These data shall provide information to generate rate and trends. (e.g. driven km, operating hours).</li> </ul>  | <ul> <li>(d) Statistics: Data Series shall<br/>be collected to support the<br/>analysis process with<br/>additional information. These<br/>data shall provide<br/>information to generate rate<br/>and trends.</li> </ul>  |  |

|  | 5.7.2.6. The manufacturer shall have a<br>mechanisms in place for receiving<br>feedback and analyse safety<br>relevant feedback and reports from<br>other sources to extract safety-<br>relevant information and to review<br>the safety monitoring data. |
|--|---|
|  | 5.7.2.6.1 The feedback and reports from<br>other sources shall include but not<br>limited to:   |
|  | (a) ADS related maintenance and inspection feedback.  |
|  | <ul> <li>(b) Public feedback (including<br/>through a helpline, web page,<br/>social media and other<br/>sources).</li> </ul>   |
|  | <ul> <li>(c) Enforcers (including the police) and other authorities' reports.</li> </ul>  |
|  | (Secy) Define "enforcer".   |
|  | (d) Service operator, customer<br>and dealer feedback.  |
|  | (Secy) Define "service operator". Wouldn't this be a "customer"?  |
| 5.7.2.5. The data monitoring programme shall<br>identify KPIs to assure that the monitoring<br>is performing at an optimal level, and<br>address any issues affecting the<br>effectiveness of the monitoring program<br>(e.g., data corruption or loss, or result in<br>delayed or degraded event detection).<br>Examples of KPIs for monitoring are trip<br>collection rate, i.e. time between actual | Proposal to delete all.   |

|          | safety occurrence and detection of the<br>occurrence (Date of detection of the<br>occurrence by the In service Monitoring<br>Date of the actual occurrence of the<br>event).  |  |  |
|----------|---|--|--|
| 5.7.3.2. | Following the results obtained from the monitoring, the manufacturer shall evaluate:  | 5.7.2.7. The manufacturer shall evaluate the results from the monitoring activity to assess:   |  |
|          | (a) In-service safety performance.  |  |  |
|          | (b) The adequacy of the metrics and thresholds.   |  |  |
|          | (c) Any remedial actions.   | <ul><li>(c) The outcome of remedial actions.</li><li>(Secy) Redundancy: 5.7.2.4 (g) Confirm the effectiveness of any remedial action.</li></ul>  |  |
| 5.7.3.   | Monitoring of performance   | (OPI) Delete.  |  |
| 5.7.3.1. | <ul> <li>The monitoring of the ADS performance shall:         <ul> <li>(a) Provide evidence of in service safety performance of the ADS as per the objectives of the periodic reporting.</li> <li>(b) Enable the identification of a drift or deviation from the demonstrated declared performance including the ones that end in an occurrence.</li> </ul> </li> </ul> | (OPI) Delete.  |  |
| 5.7.4.   | Reporting by the manufacturer   | 5.7.3.   |  |
|          |   | (Secy) General observation:<br>This reporting section has a logical fallacy:<br>compliance with the reporting requirements<br>cannot be verified until after the ADS has been<br>validated for compliance with this regulation<br>(e.g., approved and in service). |  |

|          |   | consider moving t<br>into an annex and<br>requirements to "n<br>provisions as need<br>the manufacturer"<br>meet the reporting<br>the monitoring reasince they address<br>and data analysis | acy, the IWG may wish to<br>the "reporting requirements"<br>limiting the main regulation<br>monitoring" with one or more<br>ded to ensure verification that<br>has the capabilities in place to<br>g requirements. (In large part,<br>quirements already do this<br>s monitoring, data collection,<br>to produce the information<br>porting requirements.) |  |
|----------|---|--|--|--|
| 5.7.4.1. | The manufacturer shall report, as required<br>by the relevant authority, in accordance<br>with this section and the subsections<br>below on "Occurrence reporting" and<br>"Tools for reporting". Two types of<br>reports on the in-service safety<br>performance shall be produced. These are<br>short-term and periodic. | requ<br>on tl<br>perf<br>and<br>of th  | manufacturer shall report, as<br>hired by the relevant Authority,<br>he in-service safety<br>formance of the ADS vehicle<br>provide confirmatory evidence<br>he audit results of the Safety<br>hagement System.  |  |
|          |   | acco<br>each<br>acco<br>avai   | reporting shall be carried out<br>ording to the laws applicable in<br>a contracting party and<br>ording to the information<br>lable to the manufacturers.  |  |
|          |   | occu<br>ever   | manufacturer shall report on<br>urrences/[safety-relevant]<br>nts when, at least, one of the<br>owing is fulfilled:  |  |
|          |   | (a)  | The ADS was active when<br>the ADS vehicle was<br>involved in the<br>occurrence/[safety-relevant<br>events].   |  |

| 5.7.3.13. | The reporting scheme applies to<br>automated vehicle features of an ADS<br>which was active during a critical<br>occurrence or up to 30 seconds prior to the<br>critical occurrence.   |          | (b) The ADS was active up to 30<br>seconds prior to the ADS<br>vehicle experiencing the<br>occurrence/[safety-relevant<br>events]. |  |
|-----------|--|----------|--|--|
| 5.7.4.2.  | Short term reporting of occurrences and<br>safety concerns is required for matters of<br>such safety importance that they may<br>require the manufacturer to take remedial<br>action, including:   | 5.7.3.3. | The manufacturer shall report on<br>short term basis for the following<br>occurrences:   |  |
|           | (a) Indications of failure to meet safety requirements.  |          | (a) Indications of failure to meet safety requirements.  |  |
|           | (b) Critical occurrence where the ADS was involved known to the ADS manufacturer or OEM.   |          | (b) Critical occurrences where<br>the ADS was involved known<br>to the ADS manufacturer or<br>OEM.                                 |  |
|           | (c) Other safety-relevant performance issues.  |          | (c) Other occurrences in [X].  |  |
|           |  |          | <ul> <li>(d) Other performance issues<br/>constituting an unreasonable<br/>risk to safety.</li> </ul>                              |  |
| 5.7.3.11. | Short term reporting is due within one<br>month of the manufacturer's knowledge of<br>the matter. Short term reporting is needed<br>to provide awareness of situations in<br>which the ADS may be or is posing an<br>unreasonable risk to safety in-service. | 5.7.3.4. | The manufacturer shall issue a short-term report within 30 days from the knowledge of the matter.                                  |  |
| 5.7.3.12. | Manufacturers shall notify such concerns<br>promptly upon their identification and to<br>issue a report within 30 days form the<br>knowledge of the matter.  |          |  |  |
| 5.7.4.3.  | At national level, there may be further<br>requirements for immediate<br>reporting/notification to the authority <b>The</b>  | 5.7.3.5. | The manufacturer shall notify the<br>relevant Authority of a critical<br>occurrence without unreasonable                           |  |

|           | manufacturer shall notify the relevant<br>Authority as soon as practical about<br>any critical occurrence the<br>manufacturer becomes aware of or in<br>the event the ADS manufacturer becomes<br>aware of a failure/defect which poses an<br>immediate risk to public safety. | delay but no later than [24/48]<br>hours after becoming aware of it.   |  |
|-----------|--|--|--|
|           |  | 5.7.3.5.1. The initial notification may be<br>limited to high-level data (e.g.,<br>location, time, type of accident).  |  |
| 5.7.3.17. | The short term template (Annex [x])<br>provides a list of information with<br>corresponding specifications that shall be<br>made available to the <b>relevant</b> authority<br>following the occurrence of an event<br>flagged under the "Short term reporting".               | 5.7.3.6. The manufacturer shall report in accordance with the short term template in Annex X, as required by the relevant Authority, following the occurrences flagged under the "Short term reporting" in Y.  |  |
| 5.7.4.4.  | The manufacturer shall also undertake<br>periodic reporting of performance metrics<br>and occurrences to the safety relevant<br>authority.   | 5.7.3.7. The manufacturer shall undertake<br>periodic reporting of [safety-<br>relevant events] and occurrences to<br>the relevant authority.  |  |
| 5.7.4.5.  | The periodic report shall provide evidence<br>of the in-service ADS safety performance.<br>In particular, it shall demonstrate that:   | <ul> <li>5.7.3.7.1. The periodic report shall provide evidence of the in-service ADS safety performance. In particular, it shall demonstrate that:</li> <li>(Secy) Ambiguity: meaning of "evidence"</li> </ul> |  |
|           | (b) The ADS fulfils the performance<br>requirements as evaluated in the test<br>methods.   | (a) The ADS fulfils the<br>performance requirements as<br>evaluated in the test methods<br>and/or declared in the safety<br>case.  |  |
|           | (a) No inconsistencies have been<br>detected compared to the ADS safety  | (b) No inconsistencies have been<br>detected compared to the<br>ADS safety performance   |  |

| performance declared prior to market<br>introduction.(c)Any newly discovered significant<br>ADS safety performance issues that<br>pose an unreasonable risk to safety<br>have been adequately addressed and<br>how this was achieved, including<br>modifications made by the ADS<br>manufacturer. |           | <ul> <li>declared prior to market<br/>introduction.</li> <li>(c) Any newly discovered<br/>significant ADS safety<br/>performance issues that pose<br/>an unreasonable risk to safety<br/>have been adequately<br/>addressed and how this was<br/>achieved including how they</li> </ul>        |  |
|---|-----------|--|--|
| <ul> <li>5.7.3.14. |        |  | 6.2.1. | The assessor shall review the<br>manufacturer's credibility framework<br>to determine whether the simulation the<br>toolchain(s) is suitable to undertake<br>virtual testing.   |  |
|        |  | 6.2.2. | The assessor shall review the documentation and evidence supporting the manufacturer's claims:  |  |
|        |  | (a)    | A successful outcome of the assessment<br>will be a confirmation that the claims<br>of the manufacturer about the<br>capability of the simulation<br>toolchain(s), including its scope, are<br>correct and that it can be used to<br>perform the virtual testing as part of the<br>ADS assessment.                          |  |
|        |  | (b)    | The simulation toolchain(s) can only be<br>used to undertake virtual testing once<br>the credibility of the same has been<br>established.   |  |
|        |  | 6.2.3. | The assessor shall audit the information<br>provided by the manufacturer and may<br>request or carry out additional tests of<br>the simulation toolchain(s) or physical<br>tests. The outcome of the tests shall be<br>reviewed and any concerns or<br>discrepancies shall be raised and<br>reviewed with the manufacturer. |  |
|        |  |        | The manufacturer shall provide an explanation of the discrepancies in the results. If the results from the simulation toolchain(s) do not   |  |

|          |   | sufficiently replicate the output of<br>physical test or does not have sufficient<br>scope the assessor shall inform the<br>manufacturer.<br>The manufacturer shall conduct extra<br>validation activity and resubmit their<br>information for further assessment.   |  |
|----------|---|--|--|
|          |   | If the assessor is not satisfied with the<br>information provided by the<br>manufacturer or the outcome of the<br>additional tests, then the assessor will<br>document those concerns and inform<br>the manufacturer. The manufacturer<br>will then have the opportunity to revise<br>the documentation and evidence and<br>resubmit. The resubmission should<br>address the concerns raised by the<br>assessor and should also clearly<br>indicate the scope of the changes and<br>whether there are any wider<br>consequences. |  |
|          |   | Annex  |  |
| 6.2.1.1. | Virtual testing uses different types of<br>simulation toolchains to assess compliance<br>of an ADS with safety requirements across<br>a wide range of traffic scenarios, including<br>some of which would be difficult (if not<br>impossible) to reproduce in physical<br>settings. |  |  |
| 6.2.1.2. | Having determined performance<br>boundaries and identified situations<br>involving ADS responses to manage<br>conflicts and mitigate risks under the<br>virtual testing, concrete test scenarios shall<br>be defined for track testing based on the                                 |  |  |

|          | parameters of the corresponding virtual<br>scenarios. Comparison of performance<br>between a virtual test and a track test<br>when executing the same scenario enables<br>assessment of the accuracy of the virtual<br>testing toolchain. |  |
|----------|---|--|
| 6.2.1.3. | The auditor shall perform an assessment<br>of the application of these analytical<br>approaches, including:   |  |

| 6.2.1.3.1. | Inspection of the documentation that shall<br>demonstrate the validation/verification<br>plans and results including appropriate<br>acceptance criteria. It shall include testing<br>appropriate for validation, for example,<br>Hardware in the Loop (HIL) testing,<br>vehicle on-road operational testing, testing<br>with real end users, or any other testing<br>appropriate for validation/verification. The<br>auditor/assessor shall perform an<br>assessment of the physical testing (proving<br>ground and/or public road) environment<br>and should assess the documentation of<br>the virtual toolchain(s) provided by the<br>manufacturer. The auditor/assessor shall<br>carry out tests of the complete integrated<br>tool to assess the credibility of the virtual<br>toolchain. Results of validation and<br>verification shall be assessed by analysing<br>coverage of the different tests and setting<br>minimal coverage thresholds for various<br>metrics. See Annex 5-Appendix 1 for<br>more information on the credibility<br>assessment. | (OPI) requirement has two main aspects: testing<br>and verification (safety assessment) and then<br>assessment of test environment. Propose to<br>split. Also can reduce redundancies.<br>(SAE) agree. Safety assessment section has<br>safety case including manufacturer<br>application/integration of VT credibility.<br>(SAFE) support split—move part to safety<br>assessment with separate section on<br>toolchain/environment evaluation process.<br>(UK) support—avoids confusion.<br>(OICA/CLEPA) support split, restructure.<br>(OPI) Will VTCA be annex or part of main<br>body—recommends in main body. Clarify<br>between requirements targeted at manufacturer<br>and provisions targeted at assessor.<br><i>Consensus note: Impacts structure and<br/>sections—proposals for revised structure.</i> |
|------------|--|--|
|            | Types of simulation toolchain approaches   |  |
|            | The simulation toolchain used for virtual<br>testing may result in the combination of<br>different approaches. In particular, there<br>are many ways that tests can be<br>performed:   |  |

|   | (a) Entirely inside a computer (referred to  |  |
|---|--|--|
|   | as Model or Software in the Loop testing,    |  |
|   | MIL/SIL), with the model of the elements     |  |
| ÷ | involved (e.g., a simple representation of   |  |
| 4 | the control logic of an ADS) interacting in  |  |
|   | a simulated environment; and/or              |  |
| ( | (b) With a sensor, a subsystem, or the       |  |
| 3 | whole vehicle interacting with a virtual     |  |
| • | environment (Hardware or Vehicle in the      |  |
| - | Loop testing, HIL/VIL). For VIL testing,     |  |
| 4 | the vehicle can either be in:                |  |
| ( | (i) A laboratory where the vehicle would     |  |
| 1 | be standing still or moving on a chassis     |  |
| • | dynamometer or on a powertrain test bed      |  |
| ; | and is connected to the environment          |  |
| 1 | model by wire or by direct stimulation of    |  |
|   | its sensors; or                              |  |
|   | (ii) A proving ground where the vehicle      |  |
| 3 | would be connected to an environment         |  |
| - | model and would interact with virtual        |  |
|   | objects by physically moving on the test-    |  |
|   | t <del>rack.</del>                           |  |
| ( | (c) With a subsystem interacting with a      |  |
|   | real driver (Driver in the Loop testing,     |  |
| - | <del>DIL).</del>                             |  |
|   | Later at a patient between the sector of the |  |
|   | Interaction between the system and the       |  |
| • | environment                                  |  |
| , | The interaction between the system under     |  |
|   | the test and the environment can either be   |  |
|   | an open or closed loop.                      |  |

| In open loop virtual testing a data                 |  |
|---|--|
| provision unit provides input stimuli to an         |  |
| ADS. The data provision unit can provide            |  |
| data that was collected from a real world           |  |
| drive or from a different data source. For          |  |
| example, data can be generated during a             |  |
| test using an environment simulator. In             |  |
| any case, the provided data establishes an          |  |
| environment for the ADS. Compared to                |  |
| closed loop testing there is no feedback            |  |
| between the data provision unit and the             |  |
| ADS. As a common use case is the re-                |  |
| computation of recorded drives, open loop           |  |
| testing is sometimes referred to as re-             |  |
| compute, replay or re simulation. A useful          |  |
| property of open loop testing is the                |  |
| inherent small gap between a virtual test           |  |
| and a corresponding collected real world            |  |
| situation, as the open loop test can be as          |  |
| realistic as the used collection mechanism          |  |
| allowed for, with, under ideal                      |  |
| circumstances, no additional error                  |  |
| introduced by the open loop approach.               |  |
| Potential applications of open loop testing         |  |
| include:  |  |
| <ul> <li>Regression tests for previously</li> </ul> |  |
| resolved issues as well as tests for                |  |
| newly introduced ADS features.                      |  |
| Re validation of previously validated               |  |
| features, e.g., as part of the validation           |  |
| of an improved ADS, especially for                  |  |
| features that have no associated                    |  |
| functional change.                                  |  |
| The testing of non-functional                       |  |
| properties of the ADS. For example,                 |  |
| evaluating scheduling or timing                     |  |
| behavior of executables.                            |  |

| In shadow mode testing, an ADS that is<br>subject to testing is connected to a data<br>provision unit. However, the ADS tested is<br>not controlling the vehicle itself. Indeed, it<br>has no effect on the state or behavior of<br>the controlling unit of the vehicle. This<br>approach enables realistic large scale<br>testing with a fleet of vehicles as test<br>platforms. Since the ADS that is subject to<br>testing has no effect on the vehicle, using<br>a shadow mode can be categorized as<br>open loop testing. |  |
|--|--|
| Closed loop virtual tests include a<br>feedback loop that continuously sends<br>information from the "closed loop"<br>controller back to the ADS when the ADS<br>takes an action. Within these test systems,<br>the digital objects in the environment<br>could react in different ways depending on<br>the action of the system under test.   |  |
| Selecting an open-or closed loop test<br>could depend on factors such as the<br>objectives of the virtual testing activity<br>and the status of development of the<br>system under test.   |  |

| The flexibility of simulation makes is a standard test method during a vehicle's design and the development of this pillar will also make is part of the ADS will also make is part of the ADS will be impossible to test the vehicle's behaviour in the real world for all possible situations as well as for any subsequent change in the ADS' driving logic. Virtual testing will therefore become an indispensable tool-to verify the capability of the automated system to ded with a wide variety of possible scenarios. In addition, virtual testing can be beneficial in replacing being where there are concerner over affect to be the test of the test of the standard during the verify the capability of the automated system to ded with a wide variety of possible scenarios. It is recommended therefore hear first and/or unsafe to test the verify that address replacing a start verifical scenarios that would be difficult and/or unsafe to reproduce on test treks or public reads.         Virtual tests used for ADS wildation can achieve different objectives depending on the overall validation strategy and the accuracy of the underlying simulation and models.         (a) Provide qualitative confidence in the astety of the full system (coverds apply);         (b) Contribute interest of specific and contained confidence in the astety of the full system (coverds apply);         (c) Provide qualitative confidence in the astety of the full system (coverds apply);         (c) Provide public termines of specific and contained confidence in the artistical contained confidence in the strategy of the termines of specific and contained confidence in the strategy of the termines of specific and contained confidence in the and/out of the full system (coverds apply);  |   |  |
|---|---|--|
| design and the development of this pillar         will also make it part of the ADS         validation process. For an ADS, it will be         impossible to test the vehicle's behaviour         in the real world for all possible situations         as well as for any subsequent change in         the ADS' driving logic. Variant lessing will         therefore become an indispensable tool to         verify the capability of the automated         system to cleal with a wide variety of         possible scenarios. In addition, virtual         testing can be beneficial in replacing real         world and proving ground testing where         there are concern over safety critical         testifie scenarios. It is recommended         therefore that witual testing be used to test         the ADS' dirival scenarios         that would be difficult and/or unsafe to         reproduce on test tracks or public roads.   | The flexibility of simulation makes it a      |  |

| 6.2.1.4. | In contrast to all its potential benefits, a<br>limitation, of this approach, is in its<br>intrinsic potentially limited fidelity. As<br>models provide a representation of the<br>reality, the suitability of a model to<br>satisfactorily replace the real world for<br>validating the safety of an ADS has to be<br>carefully assessed. Therefore, the<br>validation of the simulation and models<br>used in virtual testing is essential to<br>determine the quality and reliability of the<br>results compared to real-world<br>performance.  | <ul> <li>(Canada) do not see requirement in provision</li> <li>(Germany) ditto—don't see value add to</li> <li>regulation</li> <li>(UK) more review to identify opportunities to</li> <li>pare down text. Agree provision has little</li> <li>specific regulatory value. |----------|--|--|
| 6.2.1.5. | A certain number of virtual tests of the<br>ADS' performance shall be compared with<br>its performance in the real world when<br>executing the same scenarios. This will<br>provide the opportunity to assess the<br>accuracy of the virtual testing toolchain<br>that is used. Given the high number of<br>scenarios that virtual testing can perform<br>compared to track testing, the validation<br>will probably need to be performed on a<br>smaller but still sufficiently<br>representative subset of the relevant<br>scenarios in order to substantiate any<br>extrapolation beyond the scenarios<br>used for the ADS' validation. |  |

Prepared by the ADS IWG secretariat

Document ADS-04-15 4<sup>th</sup> ADS IWG session 8-11 October 2024

| In the short-term, virtual testing might<br>only be conducted using simulation |  |
|--|--|
| toolchains developed and maintained by   |  |
| the ADS manufacturer. Since their design                                       |  |
| depends on the validation and verification                                     |  |
| strategies implemented by the  |  |
| manufacturer, it is recommended that   |  |
|  |  |
| simulation toolchains are not subject to                                       |  |
| regulation or standardization at this time.                                    |  |
| Rather, simulation toolchains should be  |  |
| explained and documented by the ADS  |  |
| manufacturer and its suitability assessed                                      |  |
| during the certification process. For this                                     |  |
| reason, the output of the NATM related to                                      |  |
| virtual testing ensures that documentation                                     |  |
| and data provided by the manufacturer is                                       |  |
| appropriate. Furthermore, virtual testing                                      |  |
| using modelling and simulation should be                                       |  |
| credible enough for an assessor to make  |  |
| sound decisions. Credibility is discussed                                      |  |
| further below.   |  |
| It is recommended that when validating   |  |
| the safety of the ADS, particular attention                                    |  |
| should be placed on the interaction  |  |
| between virtual testing and the other test                                     |  |
| methods. Virtual testing will have strong                                      |  |
| relationships with all the pillars of the                                      |  |
| NATM guidelines. In particular:  |  |
| With guidennies. In particular.  |  |

| (a) Virtual testing supplements physical        |  |
|---|--|
| testing to account for the quantity and         |  |
| diversity of ADS configurations, intended       |  |
| uses and limitations on use. One of the         |  |
| strengths of virtual testing is its capacity to |  |
| assess the ADS performance across               |  |
| multiple scenarios and across ranges of         |  |
| parameters within scenarios in a cost-          |  |
| effective manner. Virtual testing enables       |  |
| results of limited physical tests to be         |  |
| supplemented by verifiable data covering        |  |
| numerous instances of the test scenario, by     |  |
| varying parameters. Using this approach,        |  |
| virtual testing can demonstrate ADS             |  |
| coverage of safety critical scenarios, and      |  |
| hence provide evidence that an ADS will         |  |
| perform as intended for that type of            |  |
| scenario in the real world. These               |  |
| advantages reduce the burden on physical        |  |
| tests (offsetting their weaknesses) and help    |  |
| to improve the efficiency of the overall        |  |
| assessment process across the pillars.          |  |
| Virtual testing can also be effectively used    |  |
| to identify and cover edge cases and other      |  |
| low probability scenarios to increase           |  |
| confidence on the ADS' likely                   |  |
| <del>performances.</del>                        |  |
| (b) Virtual testing can play an important       |  |
| role in the development of traffic              |  |
| scenarios.                                      |  |
|   |  |

| (c) Virtual testing enables assessment of<br>ADS performance boundaries, enabling<br>precise definition of the boundaries<br>between collision avoidance and crash<br>mitigation. Through methods of<br>randomization and scenario compositions,<br>virtual testing enables the developer or the<br>assessor to challenge the ADS and<br>increase confidence in its performance<br>when challenged with low probability<br>events.                              |  |
|---|--|
| (d) Virtual testing will be a key element<br>in the audit assessment. Results of virtual<br>testing carried out both during vehicle<br>development and in the verification and<br>validation phase will provide valuable<br>evidence supporting the safety audit. The<br>manufacturers will need to provide<br>evidence and documentation about how<br>the virtual testing is carried out and how<br>the underlying simulation toolchain has<br>been validated. |  |
| (e) Results from real world tests can<br>improve the accuracy of simulation and<br>models.  |  |

| (f) Virtual testing can play an important    |  |
|--|--|
| role in responding to concerns identified    |  |
| through in use monitoring of ADS             |  |
| performance. Virtual testing provides a      |  |
| quick and flexible approach to analyse       |  |
| ADS performance based on real world          |  |
| events. It allows manufacturers to           |  |
| understand and verify the ADS behaviour      |  |
| and to understand why an issue may have      |  |
| occurred. It may identify an untested        |  |
| scenario, or a set of untried parameters. It |  |
| may also identify the "scale" of any issue.  |  |
| If the virtual testing does identify unsafe  |  |
| behaviour it can then also help to assess    |  |
| the efficacy of modifications to the ADS     |  |
| and ultimately to improve the overall ADS    |  |
| performance. Where appropriate, the          |  |
| information and scenario descriptions can    |  |
| be shared and integrated into scenarios      |  |
| and testing regimes worldwide.               |  |
| It is recognised that specific regulatory    |  |
| functional safety requirements are still     |  |
| under development. Virtual testing           |  |
| however, using a validated simulation        |  |
| toolchain, shows promise for assessing the   |  |
| following general safety requirements that   |  |
| are currently under consideration:           |  |
| · · · · · · · · · · · · · · · · · · ·        |  |
| (a) The ADS should drive safely and          |  |
| manage safety critical situations. These are |  |
| the requirements where virtual testing can   |  |
| play a prominent role. MIL/SIL, HIL and      |  |
| VIL virtual testing can all be used to       |  |
| assess these requirements at different       |  |
| stages of vehicle verification and           |  |
| validation.                                  |  |

|          | <ul> <li>(b) The ADS should interact safely with the user. DIL virtual testing can be helpful to support the assessment of this category of safety requirement by analysing the interaction between the driver and the ADS in a safe and controlled environment.</li> <li>(c) The ADS should safely manage failure modes and ADS should ensure a safe operational state. The use of virtual testing in these two categories is also very promising but would probably require further research work. SIL virtual testing could include simulated failures and maintenance requests. HIL and VIL virtual testing could be used to assess how the system would react to the occurrence of a</li> </ul> |   |   |
|----------|--|---|---|
|          | malfunctioning induced into the real system.   |   |   |
| 6.2.1.6. | Credibility assessment for using virtual<br>toolchain in ADS validation  | <ul> <li>(Secy) Structure: Is this assessment an integral part of the SMS?</li> <li>This section has content on the management of virtual testing and on verifying that the evidence generated by virtual testing is credible for the purposes of validating compliance with the safety requirements.</li> <li>Para. <u>5.1.1</u>, says that SMS concerns "processes to manage safety risks and to ensure safety throughout the ADS lifecycle (development, production, operation and decommissioning)".</li> <li>Para. <u>6.2.1.8.1</u>, describes a "dynamic process" involving "management" of "frequent changes". Would maintaining the toolchains be relevant to ADS lifecycle safety? Would virtual testing be used in investigations of ISMR safety concerns?</li> </ul> | <ul> <li>IWG consensus on need for full review and restructuring.</li> <li>SMS, safety assessment, credibility assessment all involved.</li> <li>(UK) perhaps not explicit link but whole point of cred assess is foundation for using toolchain for purposes of regulation. Grants permission to use toolset to demonstrate performance, etc. Manufacturer demonstrating competence to use virtual methods. So cred assess supports entire regulatory structure.</li> <li>(EC) There is also one new "simulation" method which is rather called "reprocessing": this uses the real "raw" sensor data and simulates the remaining parts of the SW-Stack! (e.g. as SIL or HIL).</li> </ul> |

|   | Para. <u>5.4.4.1.</u> of the Safety Assessment requires<br>the manufacturer to "provide a safety case that<br>affirms and provides evidence to demonstrate<br>that the ADS is free from unreasonable risks for<br>the ADS vehicle user(s) and other road users."<br>Would virtual testing be a source of such<br>evidence?<br>Neither the SMS, Safety Assessment, nor ISMR<br>requirements refer to virtual testing. Given the<br>importance of virtual testing to the assessment<br>of ADS performance, is this a gap? | (Chair) Important to note the virtual testing<br>(tools, technologies, best practice, etc.)<br>changing over time. |
|---|---|--|
| 6.2.1.6.1. Introduction, motivation, and scope  |   |  |
| 6.2.1.6.1.1. The use of Modelling and Simulation<br>(M&S) is becoming widespread thanks to<br>the increasing computational capabilities,<br>accuracy, usability, and availability of<br>M&S software packages. M&S virtual<br>testing can be beneficial for ADS safety<br>validation because it provides an<br>opportunity to overcome some of the<br>limitations of real testing and to increase<br>the number of testing scenarios.<br>Nonetheless, M&S virtual testing can<br>also lead to erroneous/seemingly correct<br>results, especially in relation to complex<br>simulations not adequately supported by<br>robust practices addressing all M&S<br>modelling and simulations aspects<br>beyond pure validation. Therefore, higher<br>confidence in M&S the credibility of the<br>virtual toolchain(s) used for ADS<br>assessment is needed so that virtual<br>testing can be used instead of and in<br>conjunction with the other pillars. In other<br>words, M&S a virtual testing if an assessor is |   |  |

| able to consider the simulation results<br>credible enough to make sound decisions<br>taking into account the potential<br>uncertainties of M&S-the same toolchain.   |  |
|---|--|
| If M&S is to be credible it needs to be<br>validated. Validating the models and the<br>simulation tools and process that make up<br>M&S toolchain is difficult and there are<br>limitations, which include the limited<br>scope of the validation tests and the<br>difficulty in gathering data to support the<br>validation procedures. The use of M&S<br>requires attention to all the factors<br>influencing the quality and validity of<br>M&S toolchain and all its separate<br>components. The aim is to: |  |
| (a) Identify a common framework to<br>determine, justify, assess and report the<br>overall credibility of the M&S toolchain.  |  |
| (b) Identify a way to indicate the levels of<br>confidence in the results when a validation<br>assessment takes place and also to<br>determine the associated domains of<br>applicability for the toolchain.  |  |
| This framework should be general enough<br>to be used for different M&S types and<br>applications. Unfortunately, the goal is<br>further complicated by the range and<br>differences of ADS features and the<br>variety of simulation tools and toolchains<br>that are used. These considerations lead to<br>the decision to use an (risk based/<br>informed) credibility assessment<br>framework that can be applied to all M&S<br>applications.   |  |

| I I   |  |
|---|--|
| The proposed credibility assessment   |  |
| framework provides a general description  |  |
| of the main aspects needed for assessing  |  |
| the credibility of an M&S solution  |  |
| toolchain together with guidelines of the   |  |
| role played by the relevant assessor in the                                       |  |
| validation process with respect to  |  |
| credibility. The assessor should investigate                                      |  |
| the documentation and evidence  |  |
| supporting credibility during the audit   |  |
| phase. It is understood that the actual   |  |
| validation tests will take place once there                                       |  |
| is sufficient evidence that a simulation tool                                     |  |
| or toolchain produces credible results.   |  |
| The outcome of the current gradibility  |  |

| assessment will define the envelope in which the wirtual toolahain ean he used to |  |
| which the virtual toolchain can be used to  |  |
| support the ADS assessment.   |  |
| Components of the credibility assessment  |  |
| framework   |  |
|   |  |

| 6.2.1.6.1.2. | The M&S A virtual toolchain could be<br>used for virtual testing if its credibility is<br>established by evaluating its fitness for the<br>intended purpose. It is recommended that<br>credibility is achieved by investigating and<br>assessing five M&S properties of the<br>virtual toolchain:   |  |
|--------------|---|--|
|              | (a) Capability—What the M&S virtual toolchain can do, and what are the associated risks.  |  |
|              | (b) Accuracy—How well M&S virtual toolchain does reproduce the target data.   |  |
|              | (c) Correctness—How sound and robust is the M&S data and the algorithms in the tools.   |  |
|              | (d) Usability—What training and<br>experience is needed and what is the<br>quality of the processes that manage its<br>use.   |  |
|              | (e) Fit for Purpose—How suitable is the M&S virtual toolchain for the assessment of the ADS within its ODD.   |  |
| 6.2.1.6.1.3. | This framework should be general enough<br>to be used for different M&S virtual<br>toolchains types and applications. The<br>goal is complicated by the range and<br>differences of ADS features and the<br>variety of simulation tools and toolchains<br>that are used. A (risk-based/informed)<br>credibility assessment framework that can<br>be applied to all M&S virtual testing<br>applications is therefore defined here. |  |

| 6.2.1.6.1.4. | The credibility assessment framework<br>provides a general description of the main<br>aspects considered for assessing the<br>credibility of a virtual toolchain together<br>with principles on the role of third parties<br>assessors in the validation process with<br>respect to credibility. The assessor shall<br>investigate the documentation and<br>evidence supporting credibility during the<br>audit phase. It is understood that the actual<br>validation tests will take place once there<br>is sufficient evidence that a simulation tool<br>or toolchain produces credible results. | (OPI) When referring to the assessor, the<br>appropriateness for type-approval and self-<br>certification shall be checked. |  |
|--------------|--|---|--|
| 6.2.1.6.1.5. | The outcome of the credibility assessment<br>defines the envelope in which the virtual<br>toolchain(s) can be used to support the<br>ADS assessment.   |   |  |
| 6.2.1.7.     | Components of the credibility assessment<br>framework and related documentation<br>requirements  |   |  |

| 6.2.1.7.1. | Therefore, credibility requires a unified          |  |
|------------|--|--|
|            | method to investigate these properties and         |  |
|            | get confidence in the M&s results. The             |  |
|            | Credibility Assessment credibility                 |  |
|            | assessment framework introduces a way              |  |
|            | to assess and report the credibility of M&S        |  |
|            | a virtual toolchain based on quality               |  |
|            | assurance criteria that allow an indication        |  |
|            | estimation of the levels of confidence in          |  |
|            | results. In other words, the credibility is        |  |
|            | established by evaluating the key                  |  |
|            | influencing factors that are <b>considered</b> the |  |
|            | main contributors to the <b>performance of</b>     |  |
|            | the virtual toolchain behaviour of the             |  |
|            | models and simulation tools and therefore          |  |
|            | affect its overall M&S toolchain                   |  |
|            | credibility: The following all have an             |  |
|            | influence on the overall M&S credibility;          |  |
|            | organizational management of the M&S               |  |
|            | activity, team's experience and expertise,         |  |
|            | the analysis and description of the chosen         |  |
|            | M&S toolset, the pedigree of the data and          |  |
|            | inputs, verification, validation, uncertainty      |  |
|            | characterization. How well each of these           |  |
|            | factors is addressed indicates the level of        |  |
|            | quality achieved by M&S the toolchain,             |  |
|            | and the comparison between the obtained            |  |
|            | levels and the required levels provides a          |  |
|            | qualitative measure of the M&S's                   |  |
|            | toolchain credibility and fitness for its use      |  |
|            | in virtual testing. A graphical                    |  |
|            | representation of the relationship among           |  |
|            | the components of the credibility                  |  |
|            | assessment framework is reported in the            |  |
|            | following figure.                                  |  |
|            |  |  |

|---|---|--|
|   | <ul><li>Team management</li><li>Data management</li></ul> |  |
| <ul> <li>6.2.1.8.1. The M&amp;S toolchain lifecycle is a dynamic process with frequent releases that shall be monitored and documented. Management activities shall be established to support the M&amp;S virtual toolchain(s) through typical product management processes. Relevant information on the following aspects shall be provided.</li> </ul>  |   |  |

| 6.2.1.8.2.   | <ul> <li>The models and simulation management shall:</li> <li>(a) Describe the modifications within the M&amp;S toolchain(s) releases.</li> <li>(b) Designate the corresponding software (e.g., specific software product and version) and hardware arrangement (e.g., XiL configuration).</li> <li>(c) Record the internal review processes that accepted the new releases.</li> <li>(d) Be supported throughout the full duration of the virtual testing utilization.</li> </ul>   | (Secy) Structure: this provision appears to<br>describe requirements for release management.           |  |
|--------------|--|--|--|
| 6.2.1.8.3.1. | Release management<br>Any virtual toolchain's version used to<br>release data for certification purposes shall<br>be stored. The virtual models constituting<br>the testing toolchain(s) shall be<br>documented in terms of the corresponding<br>validation methods and acceptance<br>thresholds to support the overall<br>credibility of the toolchain. The developer<br>shall establish and enforce a method to<br>trace generated data to the corresponding<br>toolchain version. |  |  |
| 6.2.1.8.3.2. | Quality check of virtual data. Data<br>completeness, accuracy, and consistency<br>shall be ensured throughout the releases<br>and lifetime of a tool or toolchain to<br>support the verification and validation<br>procedures.   |  |  |
| 6.2.1.8.4.   | Team's Experience and Expertise  | (Secy) This section appears to address<br>management of the virtual testing<br>personnel/organisation. |  |

| 6.2.1.8.4.1. | Even though Experience and Expertise<br>(E&E) are already covered in a general<br>sense within the organization, it is<br>important to establish the basis for<br>confidence on the specific experience and<br>expertise for M&S modelling and<br>simulation activities.  |  |
|--------------|---|--|
| 6.2.1.8.4.2. | The credibility of the M&S toolchain<br>depends not only on the quality of the<br>simulation models but also on the E&E of<br>the personnel involved in its validation<br>and usage of the M&S. For instance, a<br>proper understanding of the limitations<br>and validation domain will prevent<br>possible misuse of the M&S virtual<br>toolchain or misinterpretation of its<br>results.                 |  |
| 6.2.1.8.4.3. | <ul> <li>It is therefore important necessary to establish the basis for the ADS manufacturer's confidence in the experience and expertise of:</li> <li>(a) The teams that will internally assess and validate the M&amp;S toolchain(s) and,</li> <li>(b) The teams that will use the validated simulation toolchain for the execution of virtual testing with the purpose of validating the ADS.</li> </ul> |  |

| <ul> <li>6.2.1.8.4.4. A proper management of the team's E&amp;E increases the level of confidence on the credibility of the M&amp;S virtual toolchain(s) and its results outcomes by ensuring that the human elements underpinning the M&amp;S modelling and simulation activities are taken into consideration and any possible human component risks from the human aspect of the activity can be is controlled, through its Management System.</li> </ul>   |  |
|--|--|
| 6.2.1.8.4.5. If the ADS manufacturer's toolchain<br>incorporates or relies upon inputs from<br>organizations or products outside of the<br>manufacturer's own team, the ADS<br>manufacturer shall provide an explanation<br>of measures it has taken to manage and<br>develop confidence in the quality and<br>integrity of those inputs.  |  |
| 6.2.1.8.4.6. The team's Experience and Expertise includes consists of two aspects levels:  |  |
| <ul> <li>(a) Organizational level         The credibility is established by setting up processes and procedures to identify and maintain the skills, knowledge, and experience to perform M&amp;S modelling and simulation activities. The following processes shall be established, maintained and documented:         (i) Process to identify and evaluate the individual's competence and skills.         (ii) Process for training personnel to be competent to perform M&amp;S-modelling and simulation-related duties.     </li> </ul> |  |

| (b)         | Team level   |  |
|-------------|--|--|
|             | Once a toolchain has been finalized, its<br>credibility is mainly dictated by the skills and<br>knowledge of the teams that will first<br>validate the M&S it and then use it for the<br>validation of ADS. The credibility is<br>established by documenting that these teams<br>have received adequate training to fulfil their<br>duties.  |  |
| 6.2.1.8.4.7 | <ul> <li>c. The ADS manufacturer shall:</li> <li>(a) Provide the basis for the ADS manufacturer's confidence in the Experience and Expertise of the individual/team that validates the M&amp;S toolchain.</li> <li>(b) Provide the basis for the ADS manufacturer's confidence in the Experience and Expertise of the individual/team that uses the simulation toolchain(s) to execute virtual testing to validate the ADS.</li> </ul>   |  |
| 6.2.1.8.4.8 | The ADS manufacturer shall demonstrate<br>how it applies the principles of its<br>Management Systems, e.g. ISO 9001 or a<br>similar best practice or standard, with<br>regard to the competence of its M&S<br>organization and the individuals in that<br>organization and the basis for this<br>determination. The independent assessor<br>shall not substitute its judgment for that of<br>the ADS manufacturer regarding the<br>experience and expertise of the<br>organization or its members. |  |

| 6.2.1.8.5. Data/input pedigree  |  |
|---|--|
| 6.2.1.8.5.1. The <b>data/input</b> pedigree shall <b>contain a</b><br><b>record of</b> traceability of the data and<br>inputs used <b>by the manufacturer</b> in the<br>validation of the <u>M&amp;S</u> <b>toolchain</b> . The<br>manufacturer should have a record of<br>these that allows the assessor to verify<br>their quality and appropriateness.   |  |
| 6.2.1.8.5.2. Description of the data used for the M&S toolchain validation  |  |
| 6.2.1.8.5.2.1. The ADS manufacturer shall document the data used to validate the models included in the tool or toolchain and note important quality characteristics.   |  |
| 6.2.1.8.5.2.2. The ADS manufacturer shall provide<br>documentation showing that the data used<br>to validate the models covers the intended<br>functionalities that the toolchain aims at<br>virtualizing   |  |
| 6.2.1.8.5.2.3. The ADS manufacturer shall document the calibration procedures employed to fit the virtual models' parameters to the collected input data.   |  |
| 6.2.1.8.5.3. The manufacturer shall quantify the<br>effect of the data quality (e.g. data<br>coverage, signal to noise ratio, and<br>sensors' uncertainty/bias/sampling rate) on<br>model parameters uncertainty. This will<br>be an input to the The quality of the data<br>used to develop the model will have an<br>impact on model parameters' estimation<br>and calibration. Uncertainty in model<br>parameters will be another important<br>aspect in the final uncertainty analysis of<br>the virtual toolchain. |  |

| 6.2.1.8.6. Data/output pedigree  |  |
|--|--|
| 6.2.1.8.6.1. The data/output pedigree shall contain of<br>the output data is important. The<br>manufacturer should keep a record of the<br>toolchain outputs of the M&S toolchain<br>used for its validation and ensure that it<br>is traceable to the inputs and the M&S<br>toolchain that produced it. This will form<br>part of the evidence trail for the ADS<br>validation.   |  |
| 6.2.1.8.6.2. Description of the data generated by the M&S toolchain  |  |
| 6.2.1.8.6.2.1. The ADS manufacturer shall provide<br>information on any data and scenarios<br>used for virtual testing toolchain<br>validation.  |  |
| 6.2.1.8.6.2.2. The ADS manufacturer shall document the exported data and note important quality characteristics e.g. using the correlation methodologies.  |  |
| 6.2.1.8.6.2.3. The ADS manufacturer shall trace M&S<br>the toolchain(s) outputs to the<br>corresponding M&S setup:   |  |
| <ul> <li>(a) Effect of the data quality on M&amp;S toolchain credibility:</li> <li>(i) The M&amp;S toolchain output data shall be sufficient to ensure the correct execution of the validation exercise. The data shall sufficiently reflect the ODD relevant to the virtual assessment of the ADS.</li> <li>(ii) The output data shall allow consistency/sanity check of the virtual models, possibly by exploiting redundant information.</li> </ul> |  |

|              | <ul> <li>Managing <u>stochastic</u> models</li> <li>Stochastic models shall be<br/>characterized in terms of their variance.</li> <li>The use of a stochastic models shall not<br/>prohibit the possibility of deterministic<br/>re-execution.</li> </ul>                                   |  |
|--------------|---|--|
| 6.2.1.9.     | M&S Toolchain(s) Analysis and Description   |  |
| 6.2.1.9.1.   | The M&S toolchain(s) analysis and description aim to define the whole toolchain and identify the parameter space that can be assessed via virtual testing. It defines the scope and limitations of the models and simulation tools and the uncertainty sources that can affect its results. |  |
| 6.2.1.9.2.   | General description   |  |
| 6.2.1.9.2.1  | The ADS manufacturer shall provide a description of the complete toolchain along with how the M&S data will be used to support the ADS validation strategy.   |  |
| 6.2.1.9.2.2. | The ADS manufacturer shall provide a clear description of the test objective.   |  |
| 6.2.1.9.3.   | Assumptions, known limitations, and uncertainty sources   |  |
| 6.2.1.9.3.1. | The ADS manufacturer shall motivate<br>describe the modelling assumptions<br>which guided the design of the M&S<br>toolchain. The ADS manufacturer shall<br>provide evidence on:  |  |

| a)           | How the manufacturer-defined<br>assumptions play a role in defining the<br>limitations of the toolchain  |  |
|--------------|--|--|
| (b)          | The level of fidelity required for the simulation models.  |  |
| 6.2.1.9.3.2. | The ADS manufacturer shall provide<br>justification that the tolerance for M&S<br>toolchain versus real-world correlation is<br>acceptable for the test objectives.  |  |
| 6.2.1.9.3.3. | Finally, this section shall include<br>information about the sources of<br>uncertainty in the model. This will<br>represent an important input to final<br>uncertainty analysis, which will define<br>how the M&S toolchain outputs can be<br>affected by the different sources of<br>uncertainty of the M&S toolchain used. |  |
| 6.2.1.9.4.   | Scope (it defines how the M&S toolchain is used in the ADS validation)   |  |
| 6.2.1.9.4.1. | The credibility of virtual tool shall be<br>enforced by a clearly defined scope for the<br>utilization of the developed M&S<br>toolchains.   |  |
| 6.2.1.9.4.2. | The mature M&S toolchain(s) shall allow<br>a virtualization of the physical phenomena<br>to a degree of accuracy which matches the<br>fidelity level required for certification.<br>Thus, the M&S environment will act as a<br>"virtual proving ground" for ADS testing.   |  |

|              | M&S The toolchains need dedicated<br>scenarios and metrics for validation. The<br>scenario selection used for validation shall<br>be sufficient to achieve confidence that the<br>toolchain will perform in the same manner<br>in scenarios that were not included in<br>outside of the validation scope.   |  |
|--------------|---|--|
| 6.2.1.9.4.4. | ADS manufacturers shall provide a list of<br>validation scenarios together with the<br>corresponding parameter description<br>limitations.  |  |
| 6.2.1.9.4.5. | The ODD analysis is a crucial input to derive requirements, scope and the effects that the M&S toolchain(s) must consider to support ADS validation.  |  |
| 6.2.1.9.4.6. | Parameters generated for the scenarios<br>will define extrinsic and intrinsic data for<br>the toolchain and the simulation models.  |  |
| 6.2.1.9.5.   | Criticality assessment  |  |
| 6.2.1.9.5.1. | The simulation models and the simulation<br>tools used in the overall toolchain shall be<br>investigated in terms of their impact in<br>case of a safety error in the final product.<br>The proposed approach for criticality<br>analysis is derived from ISO 26262, which<br>requires qualification for some of the tools<br>used in the development process. In order<br>to derive how critical the simulated data<br>are, the criticality assessment shall<br>consider the following parameters: |  |
|              | <ul> <li>(a) The consequences on human safety<br/>e.g. severity classes in ISO 26262;</li> <li>(b) The degree to which the M&amp;S<br/>toolchain(s) results influence the<br/>ADS.</li> </ul>   |  |

| 6.2.1.9.5.2. | The table below provides an example<br>criticality assessment matrix to<br>demonstrate this analysis. ADS<br>manufacturers may adjust this matrix to<br>their particular use case.   |  |
|--------------|--|--|
| Table 4.     | Criticality assessment matrix  |  |
| on ADS       | nificant N/A derate nor  |  |
| Neg          | gligible N/A Negligible Minor Moderate Significant Decision consequence  |  |
| 6.2.1.9.5.3. | <ul> <li>From the perspective of the criticality assessment, the three possible cases for assessment are:</li> <li>(a) Those models or tools that are clear candidates for following a full credibility assessment.</li> <li>(b) Those models or tools that may or may not be candidates for following the full credibility assessment at the</li> </ul> |  |
|              | <ul><li>discretion of the assessment at the discretion of the assessor.</li><li>(c) Those models or tools that are not required to follow the credibility assessment.</li></ul>  |  |

| 6.2.1.10     | Verification   |  |
|--------------|--|--|
| 6.2.1.10.    | The <b>toolchain(s)</b> verification of M&S<br>deals with the analysis of the correct<br>implementation of the<br>conceptual/mathematical models that<br>create and build up the overall<br>toolchain(s). Verification contributes to the<br>M&S toolchain's credibility via providing<br>assurance that the individual tools will not<br>exhibit unrealistic behaviour for a set of<br>inputs which cannot be tested. The<br>procedure is grounded based in a multi-<br>step approach described below, which<br>includes code verification, calculation<br>verification and sensitivity analysis. |  |
| 6.2.1.10.1.  | Code verification  |  |
| 6.2.1.10.1.1 | . Code verification concerns the execution<br>of tests to demonstrate that no<br>numerical/logical flaws affect the virtual<br>models.   |  |
| 6.2.1.10.1.2 | The ADS manufacturer shall document the<br>execution of proper code verification<br>techniques, e.g. static/dynamic code<br>verification, convergence analysis and<br>comparison with exact solutions if<br>applicable.  |  |

| 6.2.1.10.1.3. | The ADS manufacturer shall provide<br>documentation showing that the<br>exploration in the domain of the input<br>parameters was sufficiently wide to<br>identify parameter combinations for which<br>the M&S toolchain(s) tools show unstable<br>or unrealistic behaviour. Coverage metrics<br>of parameters combinations may shall be<br>used to demonstrate the required<br>exploration of the models' behaviours<br>performances. |  |
|---------------|---|--|
| 6.2.1.10.1.4. | The ADS manufacturer shall adopt<br>sanity/consistency checking procedures<br>whenever data allows  |  |
| 6.2.1.10.2.   | Calculation verification  |  |
| 6.2.1.10.2.1. | Calculation verification deals with the<br>estimation of numerical errors affecting<br>the M&S toolchain(s). The ADS<br>manufacturer shall document numerical<br>error estimates (e.g. discretization error,<br>rounding error, iterative procedures<br>convergence). The numerical errors shall<br>be kept sufficiently bounded to not affect<br>validation.   |  |

| 6.2.1.10.3. Sensitivity analysis  |   |  |
|---|---|--|
| 6.2.1.10.3.1. Sensitivity analysis aims t<br>model output values are a<br>changes in the model inpu-<br>identify the parameters ha<br>impact on the simulation of<br>results outputs. The sensi<br>provides the opportunity t<br>extent to which the simula<br>satisfies the validation thr<br>is subjected to small varia<br>parameters, thus it plays a<br>role to support the credibi<br>simulation results. | ffected by<br>tt values and thus<br>ving the greatest<br>model toolchain<br>tivity study also<br>o determine the<br>ation model<br>esholds when it<br>tions of the<br>fundamental |  |
| 6.2.1.10.3.2. The ADS manufacturer sh<br>supporting documentation<br>that the most critical para<br>influencing the simulation<br>outputs have been identifin<br>global sensitivity analysis<br>as by perturbing the mode   | a demonstrating<br>meters<br>• toolchain(s)<br>ed by means of<br>• techniques such  |  |
| <ul> <li>6.2.1.10.3.3. The ADS manufacturer sh that robust calibration problem adopted and that this and calibrated for assigni appropriate value to the parameters, leading to an credibility of the developed</li> </ul>  | cedures have<br>has identified<br>ng an<br>most critical<br>increase in the   |  |
| 6.2.1.10.3.4. Ultimately, the sensitivity<br>will also help to define the<br>parameters whose uncerta<br>characterization needs par<br>in order to characterize th<br>the simulation results.   | e inputs and<br>inty<br>ticular attention   |  |

| 6.2.1.10.4. Validation   |  |
|--|--|
| 6.2.1.10.4.1. The quantitative process of determining<br>the degree to which a model or a<br>simulation is an accurate representation of<br>the real world from the perspective of the<br>intended uses of the M&S toolchain. The<br>following elements shall be considered<br>when validating assessing the validity of<br>a model or simulation the toolchain:   |  |
| <ul> <li>(a) Measures of Performance (metrics)</li> <li>The Measures of Performance are metrics that are used to compare the ADS's performance within a virtual test with its performance in the real world. The Measures of Performance are defined during the M&amp;S toolchain analysis. Metrics for validation may include:</li> <li>(i) Discrete value analysis e.g. detection rate, firing rate.</li> <li>(ii) Time evolution e.g. positions, speeds, acceleration.</li> <li>(iii) Analysis of state changes e.g. distance/speed calculations, TTC calculation, brake initiation.</li> </ul> |  |
| (b) Goodness of Fit measures<br>The analytical frameworks used to compare<br>real world and simulation simulated metrics<br>are generally derived as Key Performance<br>Indicators (KPIs) indicating the statistical<br>comparability between two sets of data. The<br>validation shall show that these KPIs are met.  |  |

| (c) Validation methodology  |  |
|---|--|
| The ADS manufacturer shall define the<br>logical scenarios used for virtual testing<br>toolchain validation. They shall be able to<br>cover, to the maximum possible extent, the<br>ODD of virtual testing for ADS validation.<br>The exact methodology depends on the<br>structure and purpose of the toolchain. The<br>validation may consist of one or more of the<br>following: |  |
| <ul> <li>(i) Validate subsystem models e.g.<br/>environment model (road network,<br/>weather conditions, road user<br/>interaction), sensor models (Radio<br/>Detection And Ranging (RADAR),<br/>Light Detection And Ranging<br/>(LiDARs), Camera), vehicle model<br/>(steering, braking, powertrain).</li> </ul>   |  |
| <ul> <li>(ii) Validate vehicle system (vehicle<br/>dynamics model together with the<br/>environment model).</li> </ul>  |  |
| (iii) Validate sensor system (sensor model together with the environment model).  |  |
| (iv) Validate integrated system (sensor<br>model together with the environment<br>model with influences from vehicle<br>model).   |  |
| <ul> <li>(d) Accuracy requirement</li> <li>The requirements for the correlation<br/>threshold are defined during the M&amp;S<br/>toolchain analysis. The validation shall show<br/>that these KPIs are the necessary accuracy<br/>is met.</li> </ul>  |  |

| (e) | Validation scope (the part of the toolchain to be validated)   |  |
|-----|--|--|
|     | A toolchain consists of multiple tools, and<br>each tool will use several models. The<br>validation scope includes all tools and their |  |
|     | relevant models that require validation.   |  |
| (f) | Internal validation results  |  |
|     | The documentation shall not only provide   |  |
|     | evidence of the M&S toolchain validation<br>but also shall provide sufficient information  |  |
|     | related to the processes and products that   |  |
|     | demonstrate the overall credibility of the   |  |
|     | toolchain used. Documentation/results may<br>be carried over from previous credibility   |  |
|     | assessments.   |  |
| (g) | Independent Validation of Results  |  |
|     | The assessor shall audit the documentation   |  |
|     | provided by the manufacturer and may shall   |  |
|     | carry out tests of the complete integrated tool. If the output of the virtual tests does not   |  |
|     | sufficiently replicate the output of physical  |  |
|     | tests, the assessor may shall request that the   |  |
|     | virtual and/or physical tests to be repeated.  |  |
|     | The outcome of the tests will be reviewed<br>and any deviation in the results shall be   |  |
|     | reviewed with the manufacturer. Sufficient   |  |
|     | explanation is required to justify why the test  |  |
|     | configuration caused deviation in results.   |  |

| <ul> <li>(h) Uncertainty characterisation</li> <li>This section is concerned with characterizing the expected variability of the virtual toolchain results. The assessment shall be made up of two phases. In a first phase the information collected from the "M&amp;S toolchain analysis and description" section and the "data/input pedigree" are used to characterise the uncertainty in the input data, in the model parameters and in the modelling structure. Then, by propagating all of the uncertainties through the virtual toolchain, the uncertainty in the toolchain output of the model results is quantified. Depending on the uncertainty of the model results outputs, proper safety margins shall be introduced by the ADS manufacturer in the use of virtual testing as part of the ADS validation.</li> </ul> |  |
|---|--|
| <ul> <li>(i) Characterization of the uncertainty in<br/>the input data</li> <li>The ADS manufacturer shall<br/>demonstrate they have estimated the<br/>model's critical inputs by means of<br/>robust techniques such as providing<br/>multiple repetitions for their<br/>assessment.</li> </ul>  |  |

| <ul> <li>(ii) Characterization of the uncertainty in the model parameters (following calibration).</li> <li>The ADS manufacturer shall demonstrate that when the critical parameters of a model cannot be fully determined they are characterized by means of a distribution and/or confidence intervals.</li> </ul>  |  |
|---|--|
| <ul> <li>(iii) Characterization of the uncertainty in the M&amp;S toolchain structure</li> <li>The ADS manufacturer shall provide evidence that a proper the modelling assumptions are given a quantitative characterization by assessing the generated uncertainty generated by the modelling assumptions has been performed (e.g. comparing the output of different modelling approaches whenever possible).</li> </ul> |  |
| <ul> <li>(iv) Characterization of aleatory vs.<br/>epistemic uncertainty</li> <li>The ADS manufacturer shall aim to<br/>distinguish between the aleatory<br/>component of the uncertainty (which<br/>can only be estimated but not reduced)<br/>and the epistemic uncertainty (which<br/>instead cannot be reduced) deriving<br/>from the lack of knowledge in the<br/>virtualization of the physical process.</li> </ul> |  |

| 6.2.2.  | Documentation structure  |  |
|---|--|--|
| 6.2.2.1.  | This section <b>sets out</b> will define how the<br>aforementioned <b>above</b> information will be<br>collected and organized in the<br>documentation provided by the ADS<br>manufacturer to the relevant authority.                              |  |
| 6.2.2.2.  | The ADS manufacturer shall produce a document (a "simulation handbook") structured using this outline to provide evidence for the topics presented.  |  |
| 6.2.2.3.  | The documentation shall be delivered<br>together with the corresponding release of<br>the toolchain and appropriate supporting<br>data.  |  |
| 6.2.2.4   | The ADS manufacturer shall provide clear<br>reference that allows tracing the<br>documentation to the corresponding parts<br>of the toolchain and the data.  |  |
| 6.2.2.5.  | The documentation shall be maintained<br>throughout the whole lifecycle of the<br>toolchain utilization. The assessor may<br>shall audit the ADS manufacturer through<br>assessment of their documentation and/or<br>by conducting physical tests. |  |
| 6.3.  | Track  |  |
| 6.4.  | Real-World   |  |
| 7.  | Annexes  |  |
| Assessment of Credibility for the simulation toolchain used for virtual testing |  |  |
| 1.  | Introduction, motivation, and scope  |  |
| 1.1.  | The use of virtual testing can be beneficial<br>for ADS safety and performance<br>assessment because it provides an  |  |

|      | opportunity to overcome some of the<br>limitations of real-world testing and<br>allows a substantial increase in the number<br>of scenarios that can be tested. Virtual<br>testing can however produce erroneous but<br>seemingly correct results. This is possible<br>in any situation but particularly when<br>using complex simulation toolchains that<br>are not adequately supported by robust<br>practices that address all aspects of the<br>modelling and simulations process not just<br>validation. Therefore, confidence in the<br>credibility of the toolchain(s) is needed so<br>that it can be used for virtual testing in<br>conjunction with physical testing. A<br>toolchain can be used for virtual testing if<br>its credibility can be demonstrated whilst<br>considering its limitations, assumptions,<br>accuracy and uncertainties. |  |
|------|--|--|
| 1.2. | A simulation toolchain can be used for<br>virtual testing if its credibility is<br>established by evaluating its fitness for the<br>intended purpose. It is recommended that<br>credibility is achieved by investigating and<br>assessing five properties of the toolchain:  |  |
| (a)  | Capability – what the toolchain can do,<br>and what are the associated risks   |  |
| (b)  | Accuracy – how well does the toolchain reproduce the target results  |  |
| (c)  | Correctness – how sound & robust are the data and the algorithms in the toolchain and its components   |  |
| (d)  | Usability – what competencies are needed<br>and what is the quality of the process that<br>manage its use  |  |
|      | manage its use   |  |

| (e)  | Fit for Purpose – how suitable is the toolchain for the assessment of the ADS within its ODD.  |  |
|------|--|--|
| 1.3. | Creating an assessment framework is<br>complicated because manufacturers will<br>use a variety of toolchains from different<br>sources and with diverse features. A risk-<br>based/informed assessment framework is<br>required that can be applied to any<br>toolchain.   |  |
| 2.   | Components of the credibility framework and related documentation requirements   |  |
| 2.1. | The credibility framework is a structured<br>way to address all the necessary aspects<br>that are required to produce a toolchain<br>that is fit for purpose. A manufacturer can<br>use this to manage their approach and then<br>to make their own assessment of the<br>suitability of the toolchain. The credibility<br>is established by evaluating all the<br>relevant factors that are considered to be<br>the main contributors to the behaviour of<br>the toolchain and therefore affect its<br>overall suitability. How well each of these<br>factors is addressed indicates the quality<br>of the toolchain, and the comparison<br>between the obtained levels and the<br>required levels provides a qualitative<br>measure of the suitability of the toolchain<br>credibility and fitness for its use in virtual<br>testing. |  |
| 2.2. | A representation of the relationship among<br>the components of the credibility<br>framework is reported in the following<br>figure.   |  |

| Graphical n | Secration Secretarios   |  |
|-------------|---|--|
| 2.3.        | Release management  |  |
| 2.3.1.      | Team's Experience and Expertise   |  |
| 2.3.1.1.    | Even though Experience and Expertise<br>(E&E) are already covered in a general<br>sense within the organization, it is<br>important to establish the basis for<br>confidence on the specific experience and<br>expertise for modelling and simulation<br>activities.  |  |
| 2.3.1.2.    | The credibility of the toolchain and its use<br>for virtual testing depends on the E&E of<br>the personnel involved in its development,<br>verification, validation, deployment and<br>usage. For instance, a proper<br>understanding of the toolchain's<br>limitations and domain of applicability<br>will help to prevent its possible misuse or<br>a misinterpretation of its results. |  |
| 2.3.1.3.    | Appropriate management of the E&E of<br>the teams used by the manufacturer is an<br>element of the credibility framework. It<br>can help to ensure that the human element   |  |

|            | is taken into consideration and the risks<br>associated with this aspect of the process<br>are mitigated and controlled.   |                               |
|------------|--|-------------------------------|
| 2.3.1.4.   | Experience and Expertise exists at two levels :  |                               |
| (a)        | The manufacturer shall demonstrate how<br>the specific requirements of [this section -<br>Reference] are incorporated into its<br>organisational management system.  |                               |
| (b)        | The independent assessor shall not<br>substitute its judgment for that of the<br>manufacturer regarding the experience and<br>expertise of the organization or its<br>personnel.   |                               |
| 2.3.2.     | Data input management  |                               |
| 2.3.2.1.   | Input data and parameters associated with the toolchain  |                               |
| 2.3.2.1.1. | The manufacturer shall document the data<br>used to develop, verify and validate the<br>toolchain and its components and note<br>important quality characteristics   | (Secy) This is a requirement. |
| 2.3.2.1.2. | The manufacturer shall provide<br>documentation showing that the data used<br>to develop, verify and validate the<br>toolchain and its components covers the<br>intended functionalities that the toolchain<br>aims at virtualizing. | (Secy) This is a requirement. |
| 2.3.2.1.3. | The manufacturer shall document the data<br>and the calibration procedures employed<br>to fit any parameters associated with the<br>toolchain and its components.  | (Secy) This is a requirement. |
| 2.3.2.2.   | The manufacturer shall quantify the<br>uncertainty in the toolchain resulting from<br>the data quality (e.g. data coverage, signal   | (Secy) This is a requirement. |

|        | to noise ratio, and sensors'<br>uncertainty/bias/sampling rate). This will<br>be an input to the final uncertainty<br>analysis of the toolchain.   |  |
|--------|--|--|
| 2.4.   | Toolchain(s) Analysis and Description  |  |
| 2.5.   | Criticality assessment   |  |
| 2.5.1. | The proposed approach to assess criticality<br>is derived from ISO 26262, which requires<br>different levels of qualification for the<br>tools used in the development process. In<br>order to derive how critical the toolchain<br>and its components are the criticality<br>assessment shall consider the following<br>parameters: |  |
| (a)    | The consequences on human safety e.g. severity classes in ISO 26262  |  |
| (b)    | The degree to which the toolchain(s) and<br>its components influence the ADS. A<br>toolchain may be identified as critical but<br>more detailed analysis shows that it is a<br>tool or model within that toolchain that is<br>the key contributor to the criticality.  |  |
| 2.5.2. | The table below provides an example<br>criticality assessment matrix to<br>demonstrate this analysis. Manufacturers<br>may adjust this matrix to their particular<br>use case.   |  |
| Table. | Criticality assessment matrix  |  |

|           |  |  | 1   | 1  |  |
|-----------|--|--|---|--|--|
| Influence | Significant  | N/A  |   |  |  |
| on ADS    | Moderate   |  |   |  |  |
|           | Minor  |  |   |  |  |
|           | Negligible   |  |   | N/A  |  |
|           | Negligible   |  |   |  |  |

| 2.6.2.   | Code verification  |  |  |
|----------|--|--|--|
| 2.6.2.1. | Code verification concerns the execution<br>of tests to demonstrate that no<br>numerical/logical flaws affect the<br>toolchain or its components.  |  |  |
| 2.6.3.   | Calculation verification   |  |  |
| 2.6.3.1. | Calculation verification deals with the estimation of numerical errors affecting the toolchain.  |  |  |
| 2.6.3.2. | The assessor will review the<br>manufacturer's simulation toolchain<br>documents and evidence to determine<br>whether the manufacturer has made a<br>suitable analysis and has correctly<br>identified the source and estimates of the<br>numerical errors that affect the simulation<br>toolchain.  |  |  |
| 2.6.4.   | Sensitivity analysis   |  |  |
| 2.6.4.1. | Sensitivity analysis aims to quantify how<br>input data and parameters affect output<br>values and identify which have the<br>greatest impact. The analysis also provides<br>information that is useful in assessing<br>whether the toolchain and its components<br>can continue to satisfy the acceptance tests<br>and criteria when subjected to small<br>variations of the inputs and parameters. |  |  |
| 2.6.5.   | Validation   |  |  |
| 2.6.5.1. | The quantitative process of determining<br>the degree to which the toolchain and its<br>components are an accurate representation<br>of the system being emulated. The<br>following elements shall be considered<br>when validating the toolchain:   | (UK)<br>The assessor will consider the following<br>elements when assessing the toolchain: |  |

| (a) | Measures of Performance (metrics)   |                                 |
|-----|---|---------------------------------|
| (b) | Goodness of Fit measures  |                                 |
| (c) | Validation methodology  |                                 |
| (d) | Accuracy requirement  | (Secy) Inconsistent list style. |
|     | The correlation criteria are defined during the toolchain analysis.   |                                 |
| (e) | Validation scope (the part of the toolchain to be validated)  | (Secy) Inconsistent list style. |
|     | A toolchain consists of multiple tools, and<br>each tool may use several models. The<br>validation scope includes the toolchain, all<br>tools and models.   |                                 |
| (f) | Internal validation results   |                                 |
| (g) | Confirmatory Validation   |                                 |
| (h) | Uncertainty characterisation  | (Secy) Inconsistent list style. |
|     | This section is concerned with<br>characterizing the variability of the<br>toolchain results. The assessment shall be<br>made up of two phases. In a first phase the<br>information collected from the "toolchain<br>analysis and description" section and the<br>"input data management" section are used<br>to characterise the uncertainty in the input<br>data, in the model parameters and in the<br>various components of the toolchain.<br>Then, by propagating these uncertainties<br>through the toolchain, the overall<br>uncertainty in the toolchain's output can<br>be quantified. |                                 |
| (i) | Characterization of the uncertainty in the input data   |                                 |

|           |   | -                                  |  |
|-----------|---|------------------------------------|--|
| (ii)      | Characterization of the uncertainty in the model parameters (following calibration).  |                                    |  |
| (iii)     | Characterization of the uncertainty in the toolchain structure.   |                                    |  |
| (iv)      | Characterization of aleatory vs. epistemic uncertainty  |                                    |  |
| Annex – A | appendix: Documentation structure   |                                    |  |
| 1.        | This section sets out how the above<br>information will be collected and<br>organized in the documentation provided<br>by manufacturer to the relevant authority. |                                    |  |
| 2.        | The manufacturer shall produce a document structured using this outline to provide evidence for the topics presented.   | (Secy) This is a requirement.      |  |
| 3.        | The documentation shall be part of the toolchain release along with all the appropriate supporting data .   |                                    |  |
| 4.        | The manufacturer shall provide suitable<br>references that allows the relevant parts of<br>the toolchain and the supporting data to be<br>identified.             |                                    |  |
| 5.        | The documentation shall be maintained throughout the whole lifecycle of the toolchain.  | (Secy) Undefined term "lifecycle". |  |
