Variation of declared WLTP emissions in different segments

ICE - Gasoline

Extended Eurocar	A	B	C	D	E	F	I	G	H	J	K	L	M	N
	City	Small	Medium	Large	Executive	Luxury	Super Luxury	Sport	Supercar	MPV (small)	MPV (large)	SUV (small)	SUV (large)	Van
Eurocar Segment	A	B	C	D	E	F	S		MPV		SUV		-	
NCAP	City		Small	Large	Executive			Coupè	-	MPV (small)	MPV (large)	SUV (small)	SUV (large)	Van
ACEA	Small		Lower Medium	Upper Medium	Luxury			-		MPV		SUV		-

- Choice of classification scheme has **profound impact on segment emissions**
- Classification criteria** are often **opaque**, vehicles are classified based on the similarity **with other vehicles on the market**

- Can we provide a **transparent, standardised and reproducible methodology** for vehicles classification?
- Can we **explain** current classification through **technical specifications**?

Methodology:

overview and data sources

300'000+ vehicles

1. Statistical analysis

2. Dimensionality reduction

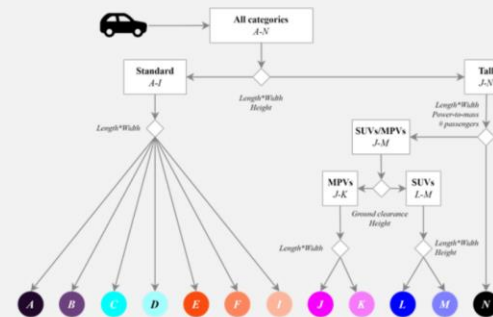

Features Selection

3. Determination of boundaries

Definition of classification criteria

4. Stepwise classification algorithm

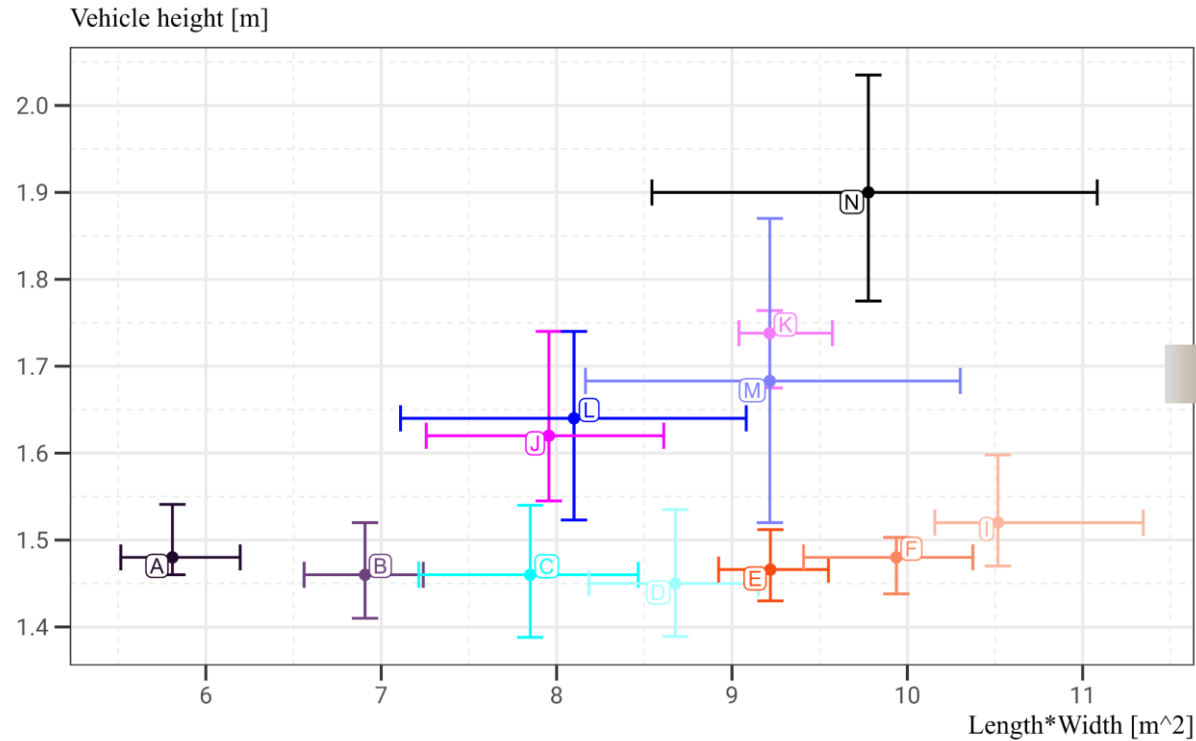

Development and verification classification algorithm

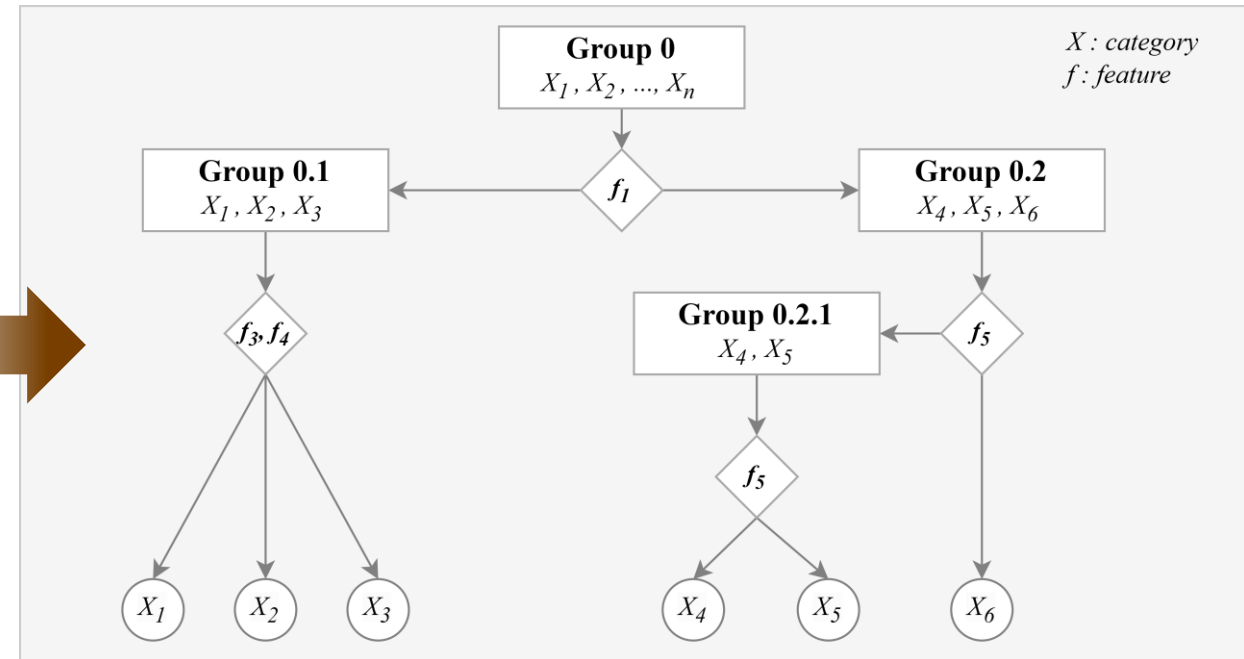

Methodology:

features selection

Height and Length x Width between standard and tall vehicles

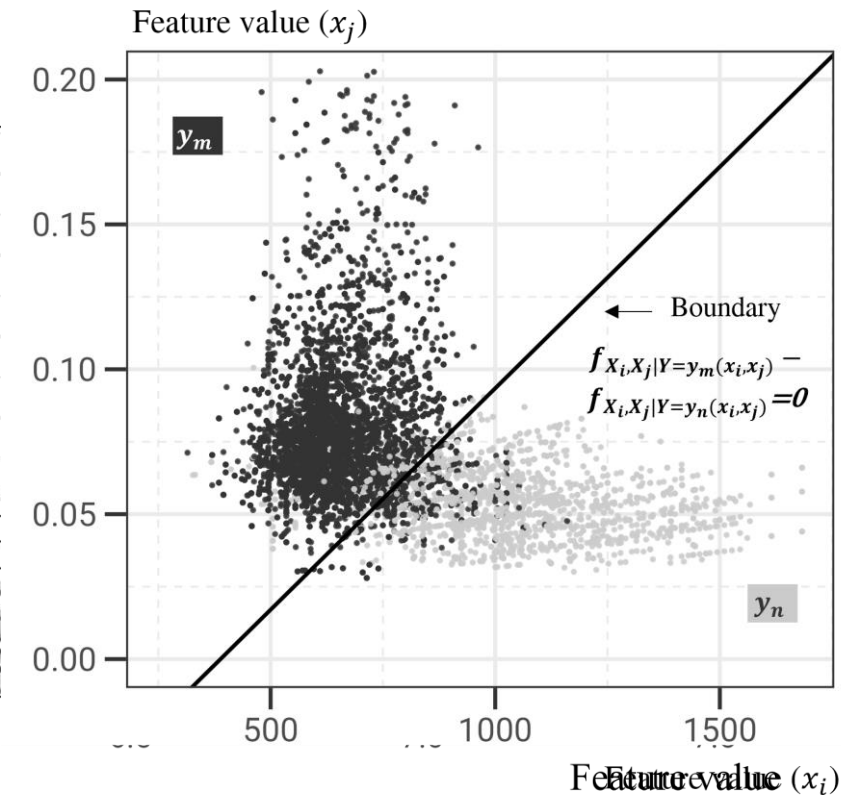

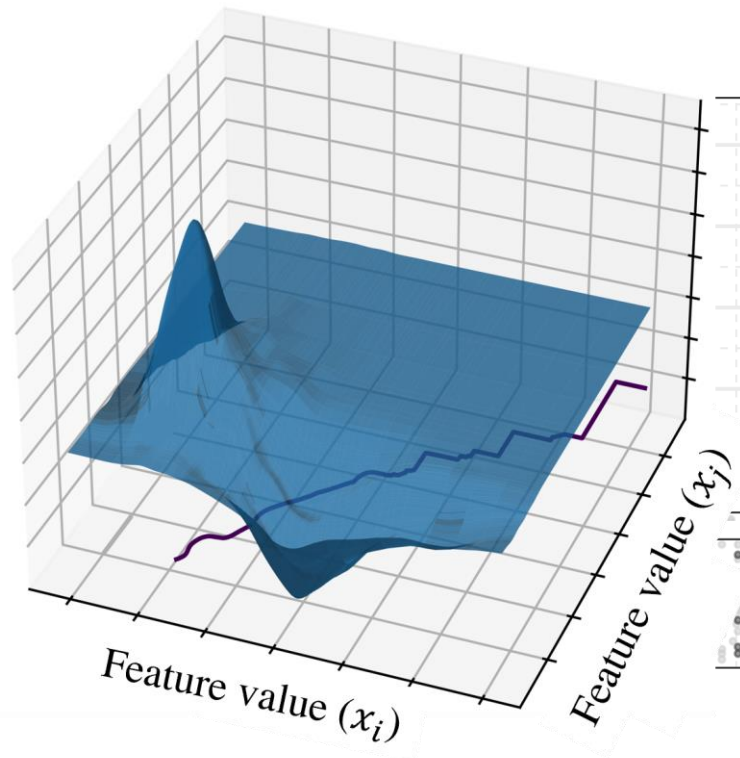

Stepwise classification approach

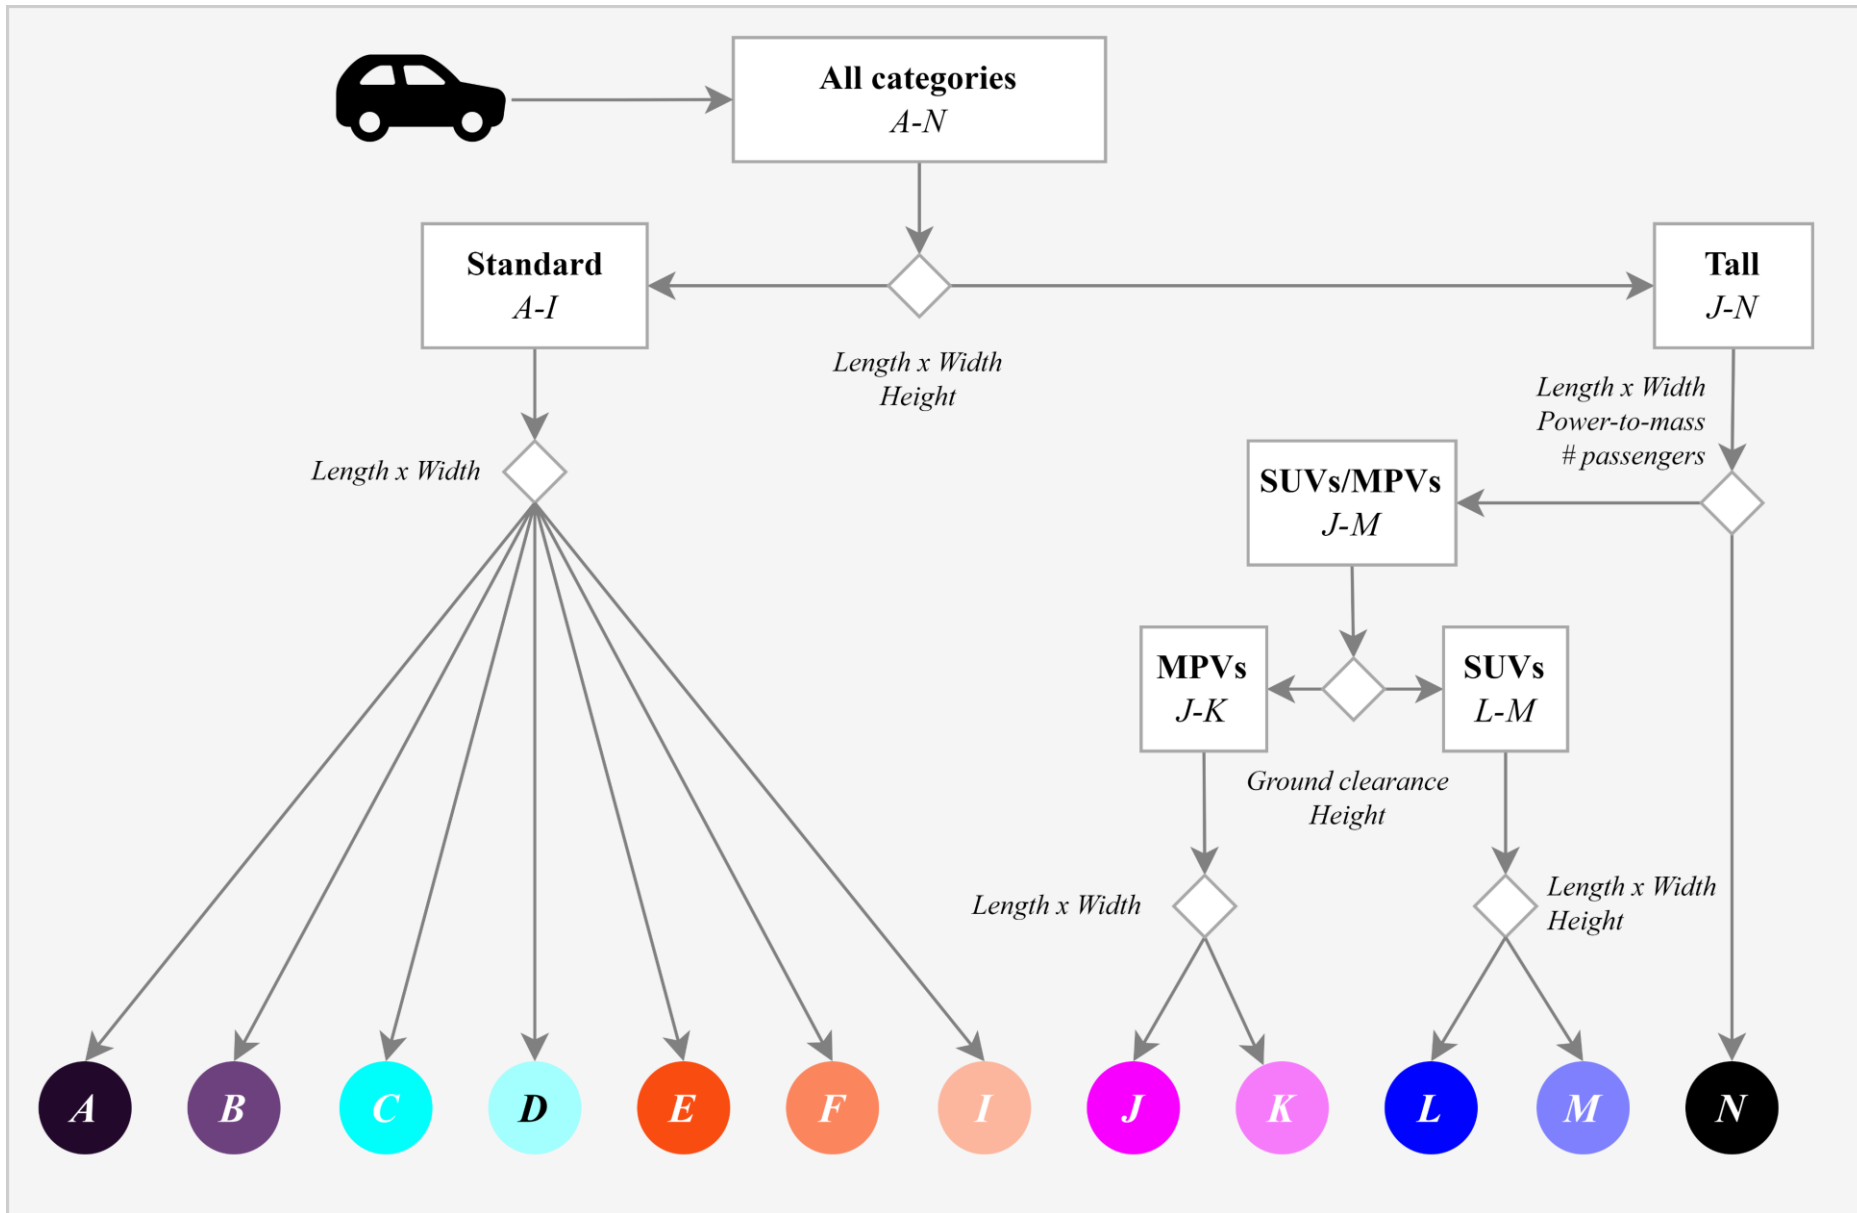

«**Classification criteria** are often **opaque**, vehicles are classified based on the **similarity with other vehicles on the market**»

- The principle of **similarity** is **well-established** in statistic literature
- It can be formulated in mathematical terms using **Probability Density Functions (PDFs)**
- PDFs are defined for each feature and segment using the **distribution of the feature** in that segment
- The higher the value of the PDF, the higher the probability that the vehicle belongs to that segment
- The **boundary** between two groups can be drawn when PDFs have the same value
- The reasoning can be extended to n-dimensions

$$f_{X_i, X_j | Y=y_m}(x_i, x_j) - f_{X_i, X_j | Y=y_n}(x_i, x_j)$$

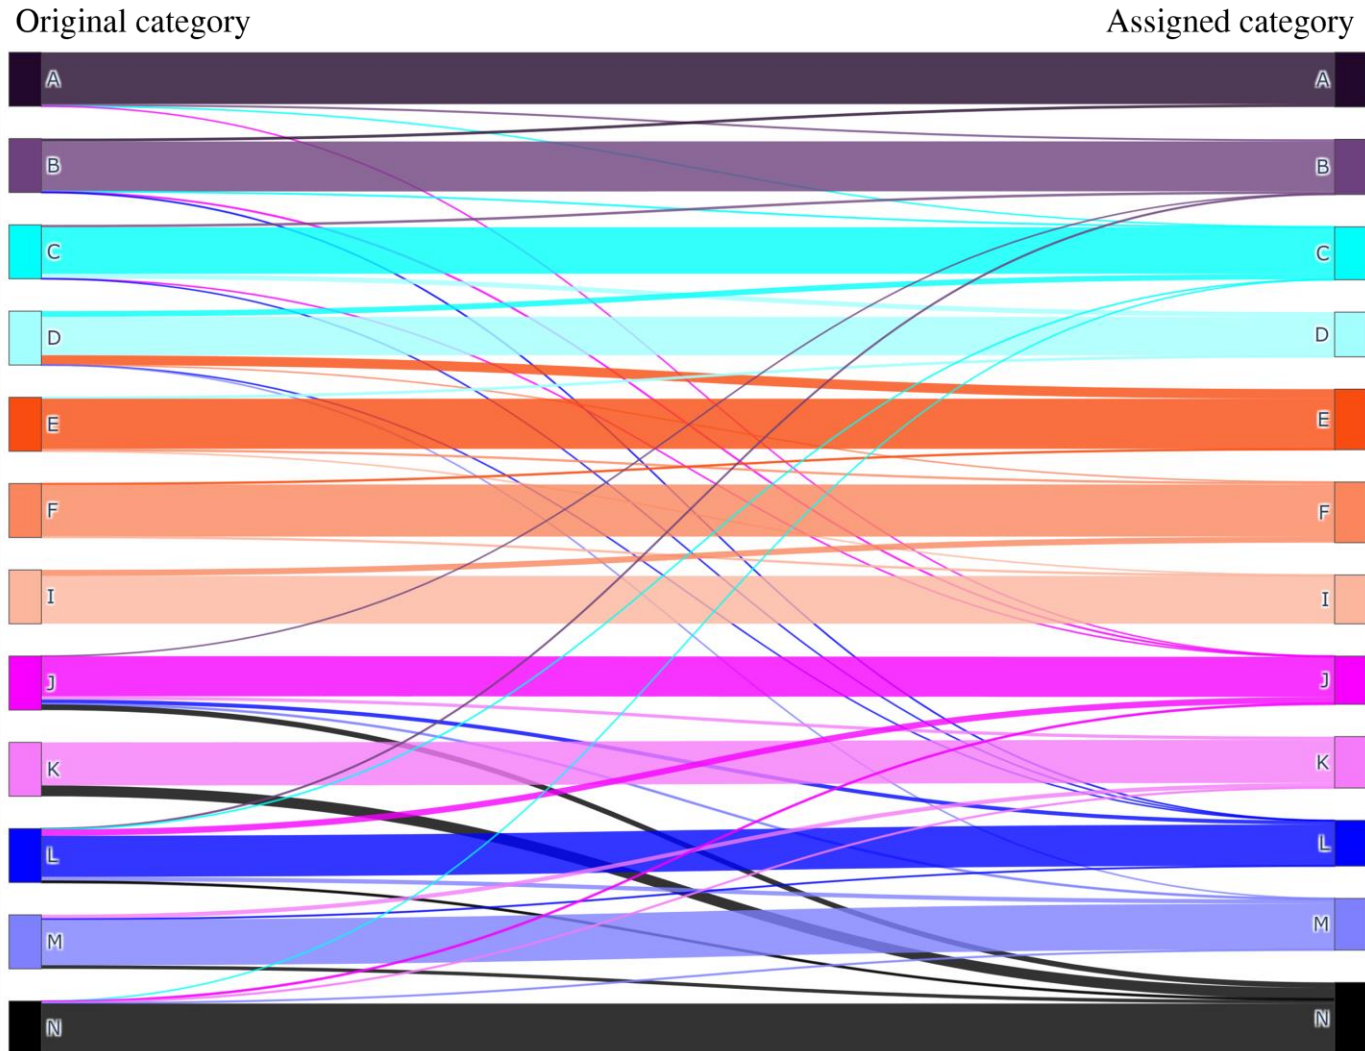

stepwise classification algorithm

Results

classification accuracy

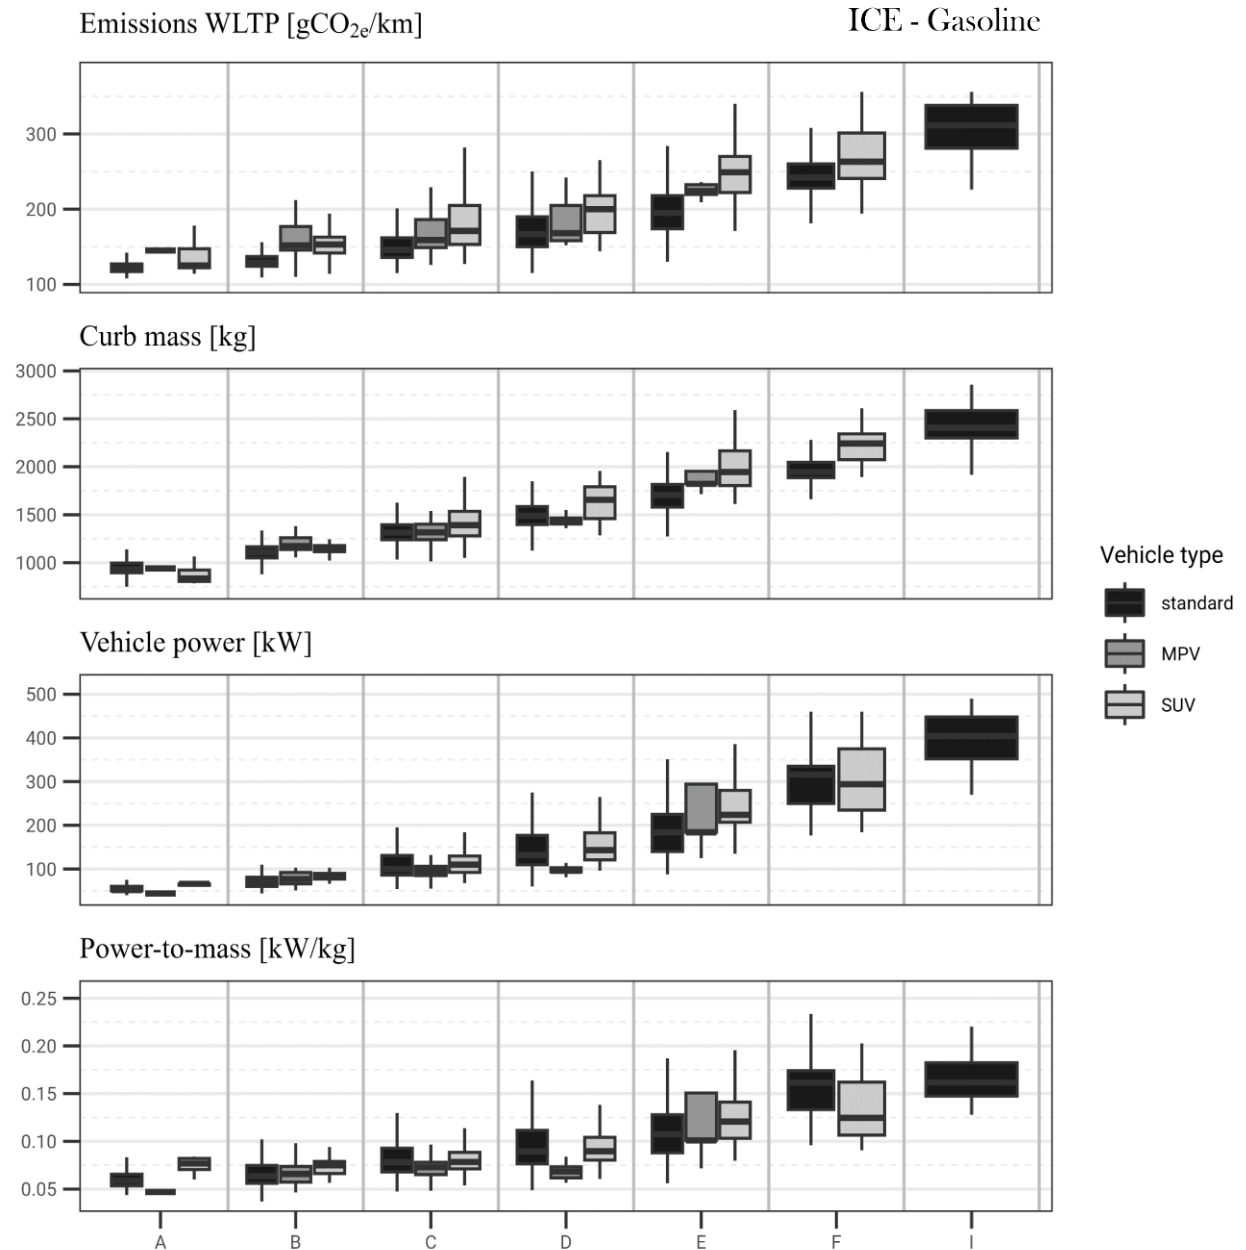

Comparison with Machine Learning algorithms

Vehicle Segment	Accuracy			
	This study	SVM	xGBoost	Dummy
A	89.5%	94.6%	100%	0%
B	87.6%	89.4%	100%	5.6%
C	81.8%	90.2%	99%	16.5%
D	70.6%	80.8%	100%	15.3%
E	92.9%	99.0%	100%	11.3%
F	96.6%	95.5%	100%	0%
I	88.7%	-	-	-
J	74.4%	72.7%	100%	8.5%
K	80.0%	87.5%	100%	0%
L	76.4%	94.1%	100%	23%
M	85.0%	81.3%	99%	9.3%
N	93.2%	91.7%	99%	5.9%
Overall	82.2%	88.9%	99.6%	12.1%

Main conclusions:

- The **designed methodology** for vehicles classification is:
 - Transparent, reproducible and replicable
 - Mathematically robust
 - **Deterministic**, with respect to other empirical approaches
 - **Compatible** with current classification approaches
- The **designed classification criteria**:
 - Was **verified** against a large set of data
 - Was able to **explain** the bulk of the extended Eurocar segment based on technical specifications of the vehicles.
 - Showed that the **distinction of MPVs and SUVs** is the most challenging part
- **MPVs and SUVs** classes still present large variability. A further classification based on the vehicle size would **improve the classification scheme**
