Updated information for the section of

*Method of Stating Energy Consumption*

Part 1: Literature review

Based on the literature review, there are four observations:

1) **Many papers were related to the assessment of energy saving and GHG emission reductions of EVs in different countries/districts;**
   
   ✓ For EU and its members
   
   • Rangaraju et al. (2015); Buekers et al. (2014); Donateo et al. (2015);
     Ma et al. (2012); Millo et al. (2014); Sánchez et al. (2013); Brouwer et al. (2013); Jochem et al. (2015); Faria et al. (2013); Holdway et al. (2010); Smith (2010)
   
   ✓ For US
   
   • Huo et al. (2015); Holdway et al. (2010); Millo et al. (2014); Thomas (2012a,b); Kim et al. (2014); Yang (2013)
   
   ✓ For China
   
   • Huo et al. (2015); Millo et al. (2014); Zhou et al. (2013); Ou et al. (2010)
   
   ✓ For Others (i.e. Japan)
   
   • Millo et al. (2014); Zhang et al. (2013)

2) **The upstream stage of power supply should be covered in the assessment of EV energy consumption;**

   The emissions from EVs depend on their own energy consumption and on the CO2 intensity of the power generation mix from which the EV’s energy should obtained. The energy consumption is the amount of energy used per unit distance traveled. The CO2 intensity of a power generation mix is the average amount of CO2 emitted per unit of electrical energy generated by all of the power production processes in a mix weighted by the amount of power obtained from each of those processes.

3) **Data about the electricity mix and upstream emissions factors of different power supplies can be collected from most countries;**

4) **Therefore, a standardized method for calculating and stating energy consumption and the associated GHG emissions for EVs is recommended for consideration.**

   It is recommended that a method be developed rather than attempt to establish a common value.
Part 2: Calculation methods suggested

The methods are suggested to use EXCEL tools to get life cycle analysis results.

1) Methods overview

• Electricity chains and vehicle running are considered in the calculation, that is, upstream and operation stages are both covered in life cycle consumption and emissions.

• Data for fossil fuel and non-fossil fuel to power:

  − Three kinds of fossil fuels including Coal, Oil and Natural gas are used as feedstock in power generation. Energy consumption and emissions include the upstream stages, such as feedstock exploration, transportation, fuel production, and transportation, in addition to the energy consumption emissions occurring in the fuel utilization; but the facility construction and vehicle manufacturing stages are excluded for their little effect on the life cycle energy consumption and emission. Take coal power for example①.

  ✓ Life cycle analysis of GHG emissions situation of coal power (the share of different stages):
  • Coal mining and processing: 10.67%
  • Coal transportation: 1.37%
  • Construction and decommissioning of the power plant: 0.2%
  • Operation of the power plant: 87.46%
  • Power transmission: 0.3%

  GHG emission the of the construction and decommissioning stage only accounts for 0.2% , so it has little effect on the life cycle emission and often be ignored.

  − Non-fossil fuels includes Hydro, Nuclear, Solar, Wind and other types. The energy consumption and emission during facility manufacturing and factory construction stages are allocated to the total power supplying during the whole life time of those power stations for they account for a very large proportion. Life cycle analysis of GHG emissions situation of different power(the share of different stages)②:

  ✓ Nuclear power (General situation):
  • Power production and operation: 81%
  • Facility construction: 19%
  • Transportation process: <0.1%
  • Backend of nuclear fuel cycle (decommissioning): data deficient, always be excluded.

  ✓ Hydro power (Typical power plants in China):

---

• Material and facility production: 4.3%
• Material and facility transportation: 2.1%
• Civil engineering construction: 70.2%
• Power production plant: 23.4%
✓ Solar power (Polycrystalline silicon solar photovoltaic):
• Material and facility production: 84.14%
• Power production and operation: 0.08%
• Power transmission: 5.5%
• Decommissioning of the power plant: 10.28%
✓ Wind power (A typical power plant in China):
• Manufacturing stage: 71.42%
• Material transportation: 10.73%
• Power plant operation and maintenance: 10.71%
• Wind power plant decommissioning: 7.14%

2) Calculation formula

● Energy consumption

✧ Life cycle energy consumption for mixed electricity generation and supply

\( E_{LC,Mixed} ^{LC,Mixed} \), MJ/MJ power supplying:

\[
E_{LC,Mixed} = \left[ \frac{E_{LC,Coal} \cdot SH_{Coal}}{\eta_{Coal\rightarrow ele}} + \frac{E_{LC,NG} \cdot SH_{NG}}{\eta_{NG\rightarrow ele}} + \frac{E_{LC,Oil} \cdot SH_{Oil}}{\eta_{Oil\rightarrow ele}} + \sum_{i=1}^{k} E_{LC,i} \cdot SH_{i} \right] \cdot \frac{1}{1 - \eta_{Loss}}
\]

✧ EV life-cycle energy consumption (\( EN_{EV} \), MJ/km):

\[
EN_{EV} = \left[ \frac{E_{LC,Coal} \cdot SH_{Coal}}{\eta_{Coal\rightarrow ele}} + \frac{E_{LC,NG} \cdot SH_{NG}}{\eta_{NG\rightarrow ele}} + \frac{E_{LC,Oil} \cdot SH_{Oil}}{\eta_{Oil\rightarrow ele}} + \sum_{i=1}^{k} E_{LC,i} \cdot SH_{i} \right] \cdot \frac{1}{1 - \eta_{Loss}} \cdot \frac{E_{EV,EN}}{\eta_{charge}} \cdot \frac{3.6}{100}
\]

✧ EV direct energy consumption in running stage (\( E_{D,EV} \), MJ/km):

\[
E_{D,EV} = E_{EV,EE} \cdot \frac{3.6}{100}
\]

✧ EV energy consumption in upstream stage (\( E_{Up,EV} \), MJ/km):

\[
E_{Up,EV} = EN_{EV} - E_{D,EV}
\]

✧ Labelling of EV direct energy consumption:

✓ \( E_{E,EV} = E_{D,EV} \cdot 100 / 3.6 \), (kWh/100km)

✓ \( E_{V,EV} = E_{D,EV} \cdot 100 / Q_{Gasoline} \), (liter/100km)

✧ PHEV life-cycle energy consumption (\( EN_{PHEV} \), MJ/km):
\[ EN_{\text{PHEV}} = \frac{E_{\text{LC,Coal}}}{\eta_{\text{Coal}} - \text{to-ele}} \cdot SH_{\text{Coal}} + \frac{E_{\text{LC,NG}}}{\eta_{\text{NG}} - \text{to-ele}} \cdot SH_{\text{NG}} + \frac{E_{\text{LC,Oil}}}{\eta_{\text{Oil}} - \text{to-ele}} \cdot SH_{\text{Oil}} + \sum_{i=1}^{k} E_{\text{LC,CH}_{i}} \cdot SH_{i} \cdot \frac{1}{1 - \eta_{\text{Loss}}} \cdot E_{\text{EM,PHV}} \cdot \frac{3.6}{100} \cdot SH_{\text{EM}} + (1 - SH_{\text{EM}}) \cdot V_{\text{Gasoline}} \cdot Q_{\text{Gasoline}} \cdot \frac{1}{100} \]

- PHEV direct energy consumption in running stage \((E_{\text{D,PHEV}}, \text{MJ/km})\):
  \[ E_{\text{D,PHEV}} = E_{\text{EM,PHV}} \cdot SH_{\text{EM}} \cdot \frac{3.6}{100} + (1 - SH_{\text{EM}}) \cdot V_{\text{Gasoline}} \cdot Q_{\text{Gasoline}} \cdot \frac{1}{100} \]

- PHEV energy consumption in upstream stage \((E_{\text{Up,PHEV}}, \text{MJ/km})\):
  \[ E_{\text{Up,PHEV}} = EN_{\text{PHEV}} - E_{\text{D,PHEV}} \]

- Labelling of PHEV direct energy consumption:
  \[ E_{\text{E,PHEV}} = E_{\text{D,PHEV}} \cdot 100 / 3.6, \text{(kWh/100km)} \]
  \[ E_{\text{V,PHEV}} = E_{\text{D,PHEV}} / Q_{\text{Gasoline}}, \text{(liter/100km)} \]

- **GHG emissions**

- Life cycle GHG emission for mixed electricity generation and supply
  \((EM_{\text{LC,Mixed}}, \text{g CO}_2\text{e/MJ power supplying})\):
  \[ EM_{\text{LC,Mixed}} = \left[ \frac{EM_{\text{LC,Coal}}}{\eta_{\text{Coal}} - \text{to-ele}} \cdot SH_{\text{Coal}} + \frac{EM_{\text{LC,NG}}}{\eta_{\text{NG}} - \text{to-ele}} \cdot SH_{\text{NG}} + \frac{EM_{\text{LC,Oil}}}{\eta_{\text{Oil}} - \text{to-ele}} \cdot SH_{\text{Oil}} + \sum_{i=1}^{k} EM_{\text{LC,CH}_{i}} \cdot SH_{i} \right] \cdot \frac{1}{1 - \eta_{\text{Loss}}} \cdot EM_{\text{EM,PHV}} \cdot \frac{3.6}{100} \]

- EV life-cycle GHG emission \((EM_{\text{EV}}, \text{g CO}_2\text{e/km})\):
  \[ EM_{\text{EV}} = \left[ \frac{EM_{\text{LC,Coal}}}{\eta_{\text{Coal}} - \text{to-ele}} \cdot SH_{\text{Coal}} + \frac{EM_{\text{LC,NG}}}{\eta_{\text{NG}} - \text{to-ele}} \cdot SH_{\text{NG}} + \frac{EM_{\text{LC,Oil}}}{\eta_{\text{Oil}} - \text{to-ele}} \cdot SH_{\text{Oil}} + \sum_{i=1}^{k} EM_{\text{LC,CH}_{i}} \cdot SH_{i} \right] \cdot \frac{1}{1 - \eta_{\text{Loss}}} \cdot EM_{\text{EM,PHV}} \cdot \frac{3.6}{100} \]

- EV GHG emission in running stage \((EM_{\text{D,EV}}, \text{g CO}_2\text{e/km})\):
  \[ EM_{\text{D,EV}} = 0 \]

- EV GHG emission in upstream stage \((EM_{\text{Up,EV}}, \text{g CO}_2\text{e/km})\):
  \[ EM_{\text{Up,EV}} = EM_{\text{EV}} - EM_{\text{D,EV}} \]

- PHEV life-cycle GHG emission \((EM_{\text{PHEV}}, \text{g CO}_2\text{e/km})\):
  \[ EN_{\text{PHEV}} = \left[ \frac{EM_{\text{LC,Coal}}}{\eta_{\text{Coal}} - \text{to-ele}} \cdot SH_{\text{Coal}} + \frac{EM_{\text{LC,NG}}}{\eta_{\text{NG}} - \text{to-ele}} \cdot SH_{\text{NG}} + \frac{EM_{\text{LC,Oil}}}{\eta_{\text{Oil}} - \text{to-ele}} \cdot SH_{\text{Oil}} + \sum_{i=1}^{k} EM_{\text{LC,CH}_{i}} \cdot SH_{i} \right] \cdot \frac{1}{1 - \eta_{\text{Loss}}} \cdot EM_{\text{EM,PHV}} \cdot \frac{3.6}{100} \cdot SH_{\text{EM}} + (1 - SH_{\text{EM}}) \cdot EM_{\text{EM,PHV}} \cdot \frac{3.6}{100} \cdot SH_{\text{EM}} + (1 - SH_{\text{EM}}) \cdot V_{\text{Gasoline}} \cdot Q_{\text{Gasoline}} \cdot \frac{1}{100} \]
- PHEV GHG emission in running stage \( EM_{D,PHEV} \text{ g CO}_2 \text{ e/km} \):

\[
EM_{D,PHEV} = (1 - SH_{Ele}) \cdot V_{\text{Gasoline}} \cdot Q_{\text{Gasoline}} \cdot EM_{\text{Gasoline}} \cdot \frac{1}{100}
\]

- PHEV GHG emission in upstream stage \( EM_{\text{Ups,PHEV}} \text{ g CO}_2 \text{ e/km} \):

\[
EM_{\text{Ups,PHEV}} = EM_{PHEV} - EM_{D,PHEV}
\]

### 3) Operating manual

The methods are based on EXCEL tools to get life cycle analysis results. Based on the data of different regions and countries input in the Yellow Cell, the results will be showed in the output cell (the Green Cell) and the labelling is presented in the Orange Cell. The data is explained in the Purple Cell.

- **Upstream stage**
  - Table A presents the data for different fossil fuel to power. A.1 is life cycle energy consumption (primary fossil energy intensity for secondary energy, MJ/MJ) and GHG emissions (g CO₂, e/MJ) situation for fossil fuel production and distribution stages. A.2 presents the electricity generation efficiency (%).

---

\*Averaged value. \( Q_{gasoline} = Q^*D/1000 \), \( Q \): gasoline calorific value, 43.07 MJ/kg (GB/T 2589-2008); \( D \): gasoline density, 720-775 kg/m³ (GB 17930-2013).

\*\( EM_{Gasoline} = 44/12^*FCO^*CEF \), \( FCO \): fuel oxidation rate, 0.98; \( CEF \): carbon emission factor, 18.9 g/MJ. (Reference: China Academy of Engineering. 2015. Greenhouse gas emissions of different power energy in China [M]. Beijing: Atomic Energy Press.)
Table B presents the data for non-fossil fuel to power.

Table C presents the data for composition of regional electrical grids (annual average).

Table D presents the data on electricity transmission loss.

Running stage

Table E presents the data on EV and HPEV charging and running. E.1 presents the charging efficiency; E.2 presents the energy consumption for EV running; E.3 presents the energy consumption for PHEV running, two different running modes are presented in the modules, including driven independently by power consumption (kWh /100 km ) and gasoline consumption ( liter/100 km ).
Table F presents the data on vehicle fuel life-cycle energy consumption and GHG emissions situation for gasoline production and utilization.

Table G presents the calculated results.

Table H presents the labelling.

Part 3: Data to collect

The following data are encouraged to submit for the calculation mentioned above:

1) Data on electricity chains
   - Life cycle energy consumption and GHG emissions situation for fossil fuel production and distribution stages of power generation (Coal, Oil, Gas)
     ✷ MJ/MJ fuel obtained
     ✷ g CO2,e /MJ fuel obtained
   - Electricity generation efficiency of fossil fuel (by type, %)
   - Life cycle energy consumption and GHG emissions situation for non-fossil
fuel power generation and supplying (Hydro, Nuclear, Solar, Wind and others)

- MJ/MJ power supplying
- g CO2,e /MJ power supplying

- Composition of regional electrical grids (Coal, Oil, Gas, Hydro, Nuclear, Solar, Wind and others, %)

- Electricity transmission loss (%)

2) Data on EV and PHEV charging and running

- Charging efficiency (%)

- Energy consumption for EV running (kWh /100 km)

- Energy consumption for PHEV running driven by electricity( kWh /100 km)

- Energy consumption for PHEV running driven by gasoline( liter /100 km)

- The range share by electricity (%)

Part 4: Stating Methods suggested

About the stating methods, some rules are suggested.

1) Labelling together
   - kWh /100 km
   - Liter (gasoline equivalent)/ 100 km

2) Considering energy consumption by upstream and operation stages
   - Upstream (percentile)
   - Operation (percentile)

3) Comparing GHG emissions to conventional gasoline vehicle
   - Total
   - By stages

Part 5: Supports are welcomed from contracting parties

1) The data listed in Part 3 should be collected with clear sources such as statistical book or formal report. The data format please see Appendix I;

2) Modifications suggestion for our suggested methods, with the presentation about the experiences of current calculation and labeling methods in other specific regions.
Appendix I: Data Collection Table

1) Data for fossil fuel to power

<table>
