

Japan position with regard to the draft of Part III of AECS-UNR

- Part III is an alternative approval method to "part I (AECD) + part II (Vehicles with regard to the installation of an AECD of an approved type)". Accordingly the requirements of part III should be equal to the requirements under part I + part II. Sled test is required under part I, therefore, part III also should include the sled test in its part.

- Some manufacturers will apply for a type approval of a complete vehicle with the AECD which is not type approved under part I , therefore part III should be provided for them.
