

DEQ Update
Injury Risk Curves

GRSP FI Group
11th of October, 2012
Paris

Equivalent Deflection (Deq)

Equivalent Deflection (Deq)

$d_{\text{localized}}(t)$
 = $F_{\text{shoulder}} / k_0$

$d_{\text{distributed}}(t)$
 $d_{\text{total}}(t)$
 -
 $d_{\text{localized}}(t)$

$d_{\text{distributed}}(t)$

= $D_{\text{drop}} - F_{\text{shoulder}} / k_0$

Equivalent Deflection (D_{eq})

$d_{\text{localized}}$

$f_n * d_{\text{distributed}}$

$$d_{\text{equivalent}} = F_{\text{shoulder}} / k_0 + f_n * (D_{\text{drop}} - F_{\text{shoulder}} / k_0)$$

Equivalent Deflection (D_{eq})

$d_{localized}$

$f_n * d_{distributed}$

$$D_{equivalent} = \alpha * F_{shoulder} + \beta * D_{dropot}$$

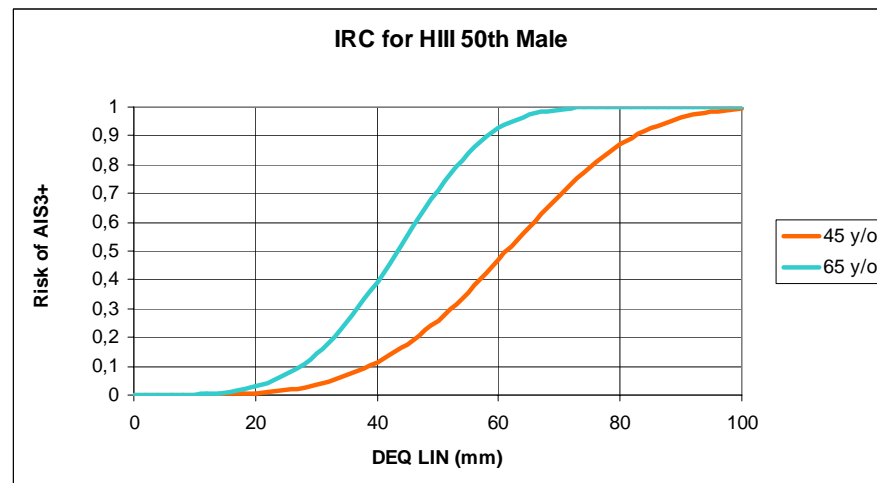

In addition...

- ⇒ Deq accounts for Rodpot not measuring the maximum deflection
- ⇒ Deq accounts for chest viscous component

⇒ HIII 50th Male

$$\text{Injury risk}(50th) = 1 - \exp\left(-\exp\left(\frac{\ln(deq) - 4.99 + 0.0174 * age}{0.246}\right)\right)$$

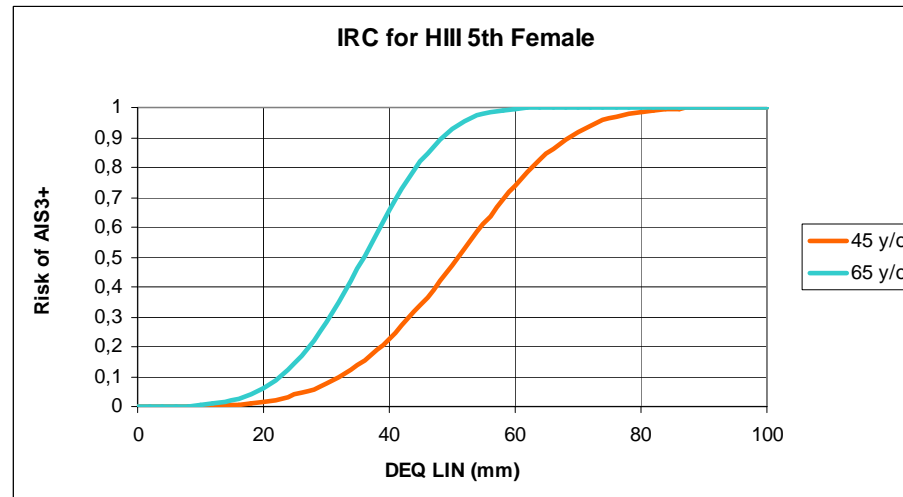

DEQ values		
HIII 50th	45 y/o	65 y/o
5%	33 mm	23 mm
25%	50 mm	35 mm
50%	62 mm	44 mm

⇒ HIII 5th Female

$$\text{Injury risk (50th)} = 1 - \exp\left(-\exp\left(\frac{\ln(\text{deq} / 0.83) - 4.99 + 0.0174 * \text{age}}{0.246}\right)\right)$$

DEQ values		
HIII 5th	45 y/o	65 y/o
5%	27 mm	19 mm
25%	41 mm	29 mm
50%	51 mm	36 mm

HIII 50th - 45 y/o

$$\text{Deq LIN} \Leftrightarrow 6.6 * \text{USBF} + 0.84 * (\text{Rodpot} - 3.7 * \text{USBF})$$

Deq IRC has nothing to do with Rodpot IRC
Ex for belt-only : 5kN / 22mm Rodpot \Leftrightarrow Deq=36mm

⇒ Laituri IRC

HIII 50th - 45 y/o

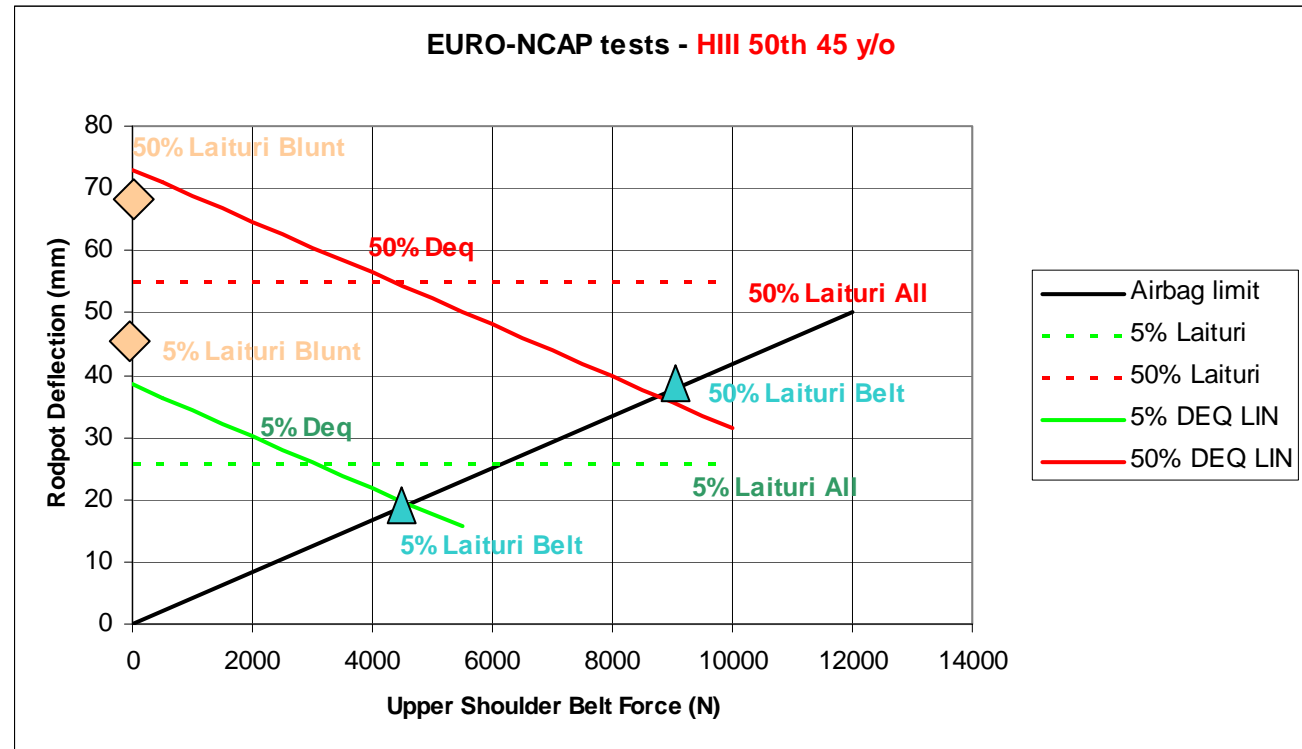

$$\text{Deq LIN} \Leftrightarrow 6.6 * \text{USBF} + 0.84 * (\text{Rodpot} - 3.7 * \text{USBF})$$

⇒ Laituri IRC

HIII 50th - 45 y/o

$$\text{Deq LIN} \Leftrightarrow 6.6 * \text{USBF} + 0.84 * (\text{Rodpot} - 3.7 * \text{USBF})$$
