

Test results

Ratio of introduced energy :

- Ni-H (1) : 2.11~2.70
- LTO (1) : 2.35~2.31
- LFP (3) : 0.23~0.66
- NCM (6) : 0.26~1.41

Can you specify
the equation here

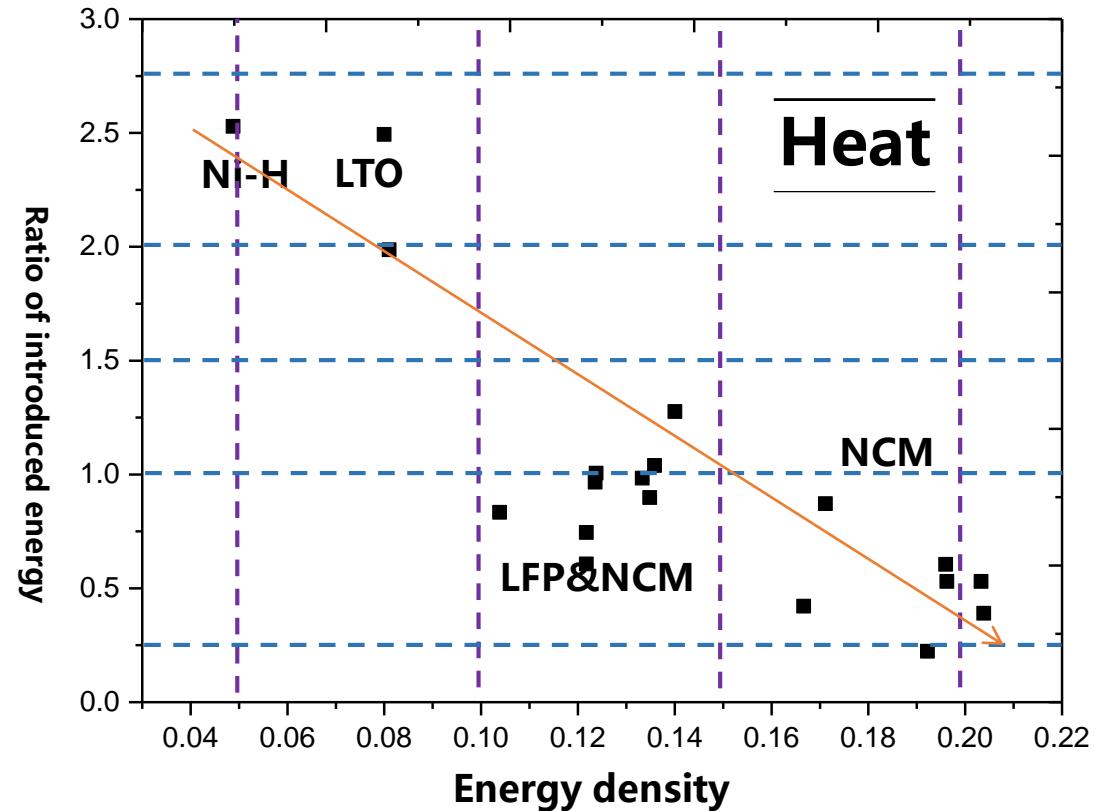

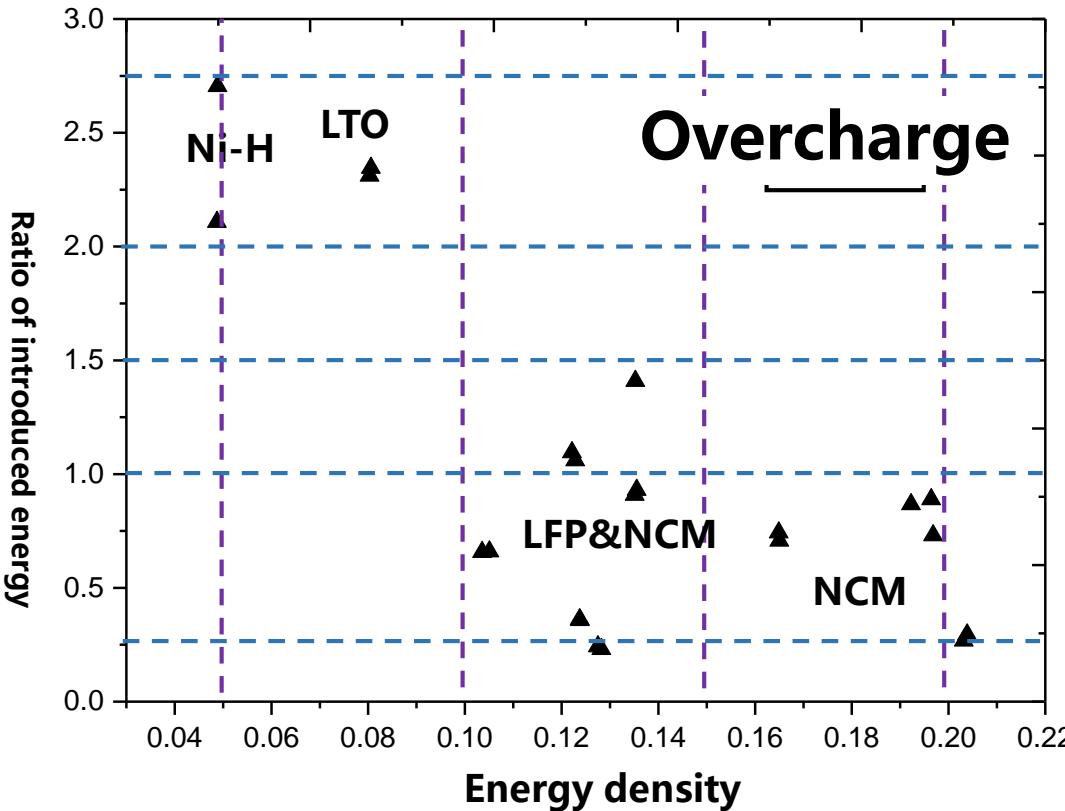

Ratio of introduced energy :

- Ni-H (1) : 2.53
- LTO (1) : 1.99~2.49
- LFP (3) : 0.83~1.28
- CNM (6) : 0.22~1.04

- The energy introduced is influenced by both the battery type and the triggering method

Test results

- The higher the energy density, the lower the energy required to trigger thermal runaway

Have you compared pouch vs prismatic during external heating? The cell format will influence this trend.
