## Studies in the light tunnel

Laboratory studies

Influence of glance behavior

Intended study

# Problem

# Studies in the Light Tunnel

## - Basics

Reflection systems

Projection systems

### Study I:

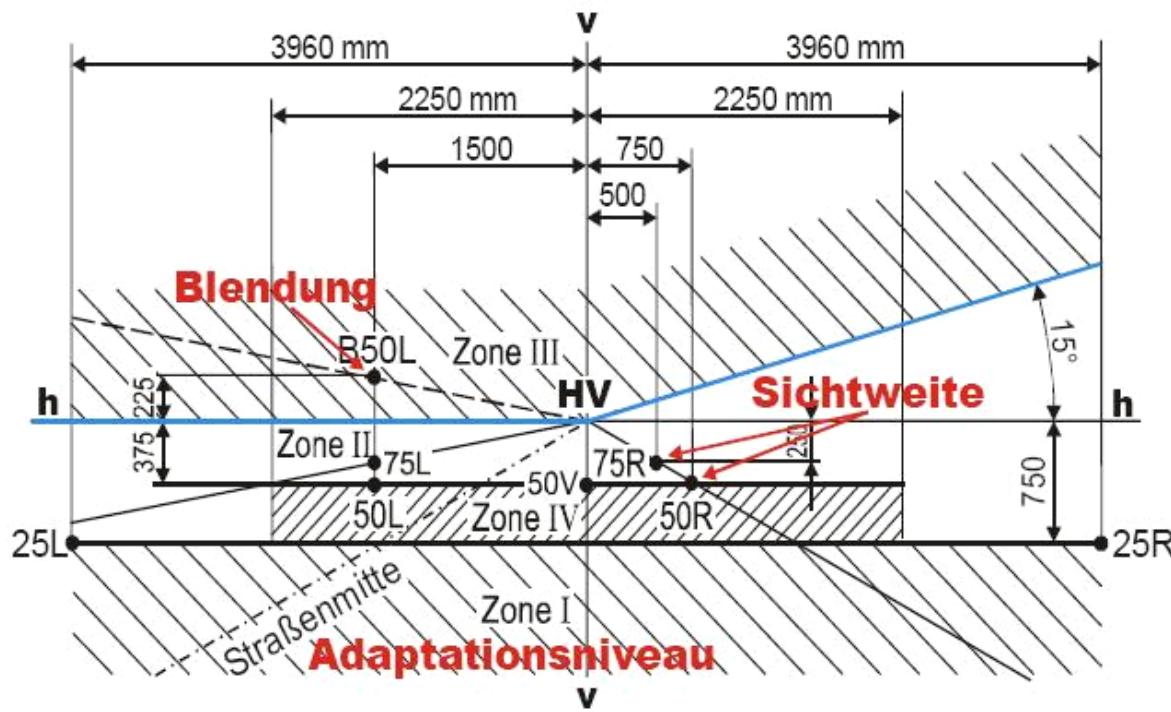

- Do Xenon headlamps dazzle more than Halogen headlamps?
- Do projection systems dazzle more than reflection systems?

### Study II:

- How does the visual performance change if a car with correct adjusted headlamps is oncoming?
- How does the visual performance change if a car is oncoming, which headlamps don't fulfill the legal requirements?

# Studies in the Light Tunnel

## - Basics

B50L

25 m 1 headlamp: 0.4 – 0.5 lux (ECE 98, ECE 112, tube)

→ 50 m 2 headlamps: 0.2 – 0.25 lux

→ actual illuminance: ~ 0.4 – 0.5 lux

# Studies in the Light Tunnel

## - Basics

Why B50L?

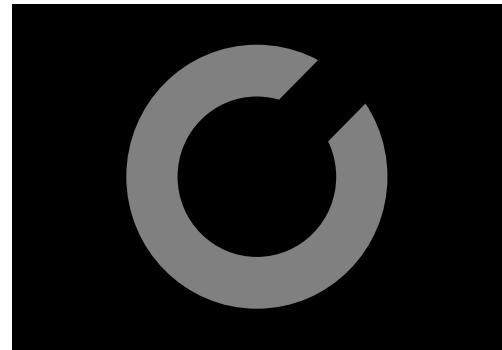

Inverse square law: Illuminance is decreasing squared to distance.  
→ The lower the distance the higher the illuminance.

But:

The lower the distance the larger the angle between glance direction (straight ahead) and glare source. It will be mapped peripherally in the eye.

In B50L the distance is quite short and the glance direction is still near the glare source. Looking at his own lane oncoming headlamps will be mapped centrally in the drivers eyes.

### Disability glare

### Discomfort glare

De Boer-Scale

Nine levels,

1: unbearable

9: unnoticeable

### Disability glare:

→ Safety

### Discomfort glare

→ Complaints!

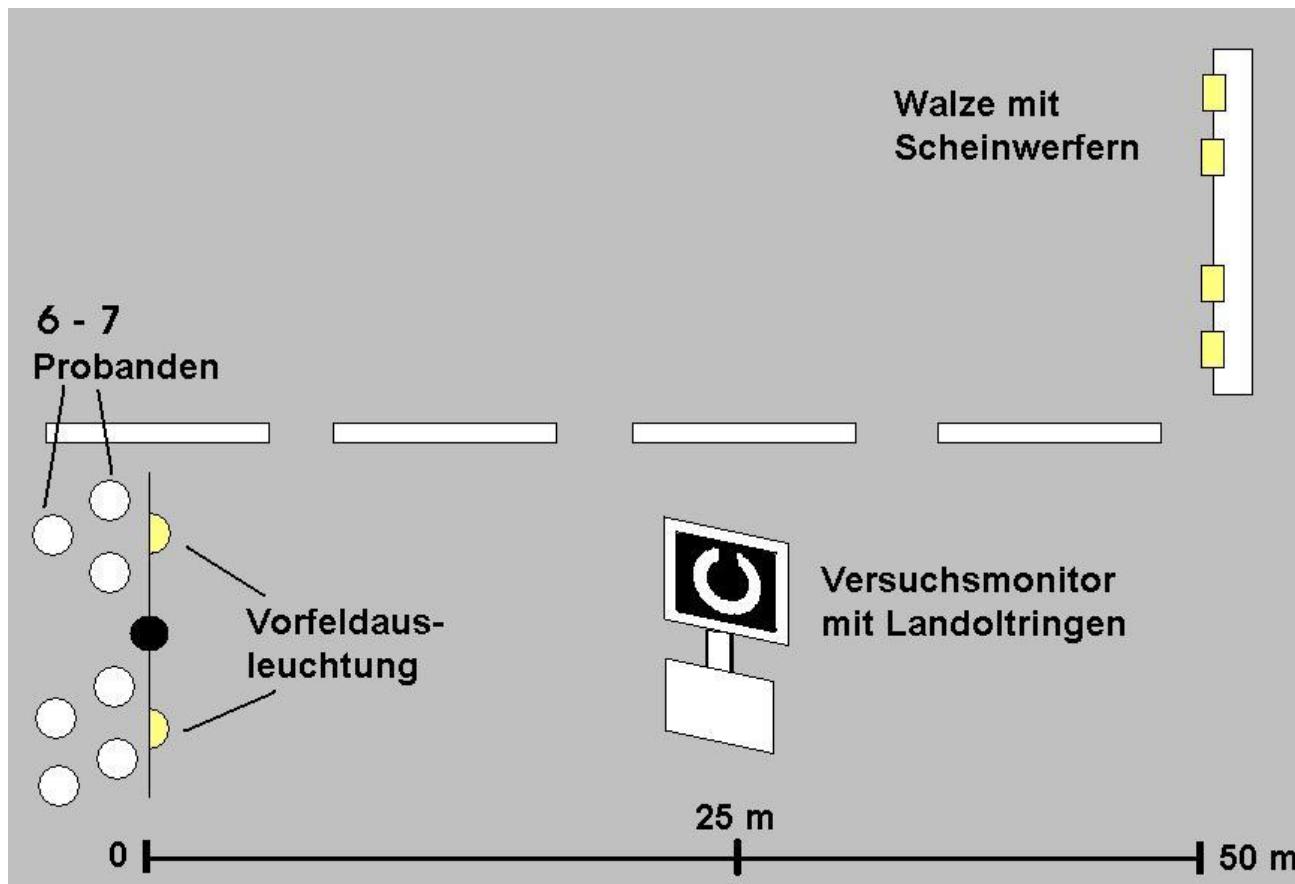

- Difficult to assess.
- Inconsistent results in studies.
- In each study a particular internal „system of reference“ is generated by test persons.
- References depending on anchor stimuli and changing perspectives.

E.g. „Considering, that I look directly into the headlamp it is quite good.“

- Results of different studies can hardly be compared.

Landolt ring

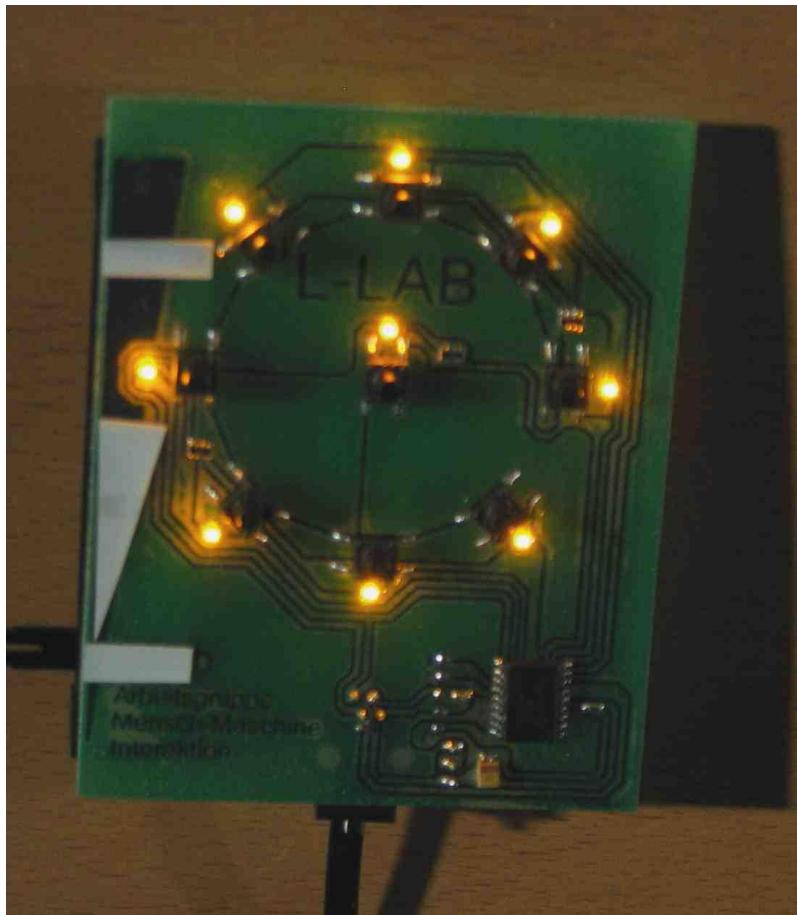

Test persons and their  
view to the glare source  
and the Landolt rings

# Studies in the Light Tunnel

## - Experimental setup

Input board with buttons for  
the Landolt openings and  
slider for discomfort glare

# Studies in the Light Tunnel

## - Experimental setup

### Study I:

- Halogen reflection system
- Halogen projection system
- Xenon projection system
- LED system I (prototype)
- LED system II (prototype)

N = 61

# Studies in the Light Tunnel

## - Experimental setup

### Study II:

- Xenon projection system
- Halogen projection system

misaligned, 1.5 lux

# Studies in the Light Tunnel

## - Experimental setup

### Study II:

- Xenon projection system
- Halogen projection system
  - misaligned, 1.5 lux
- Halogen reflection system
  - blue foil, 1,82 lux

# Studies in the Light Tunnel

## - Experimental setup

### Study II:

- Xenon projection system
- Halogen projection system
  - misaligned, 1.5 lux
- Halogen reflection system
  - blue foil, 1,82 lux
- Halogen reflection system
  - Xenon upgrade „ebay“, 1.58 lux

# Studies in the Light Tunnel

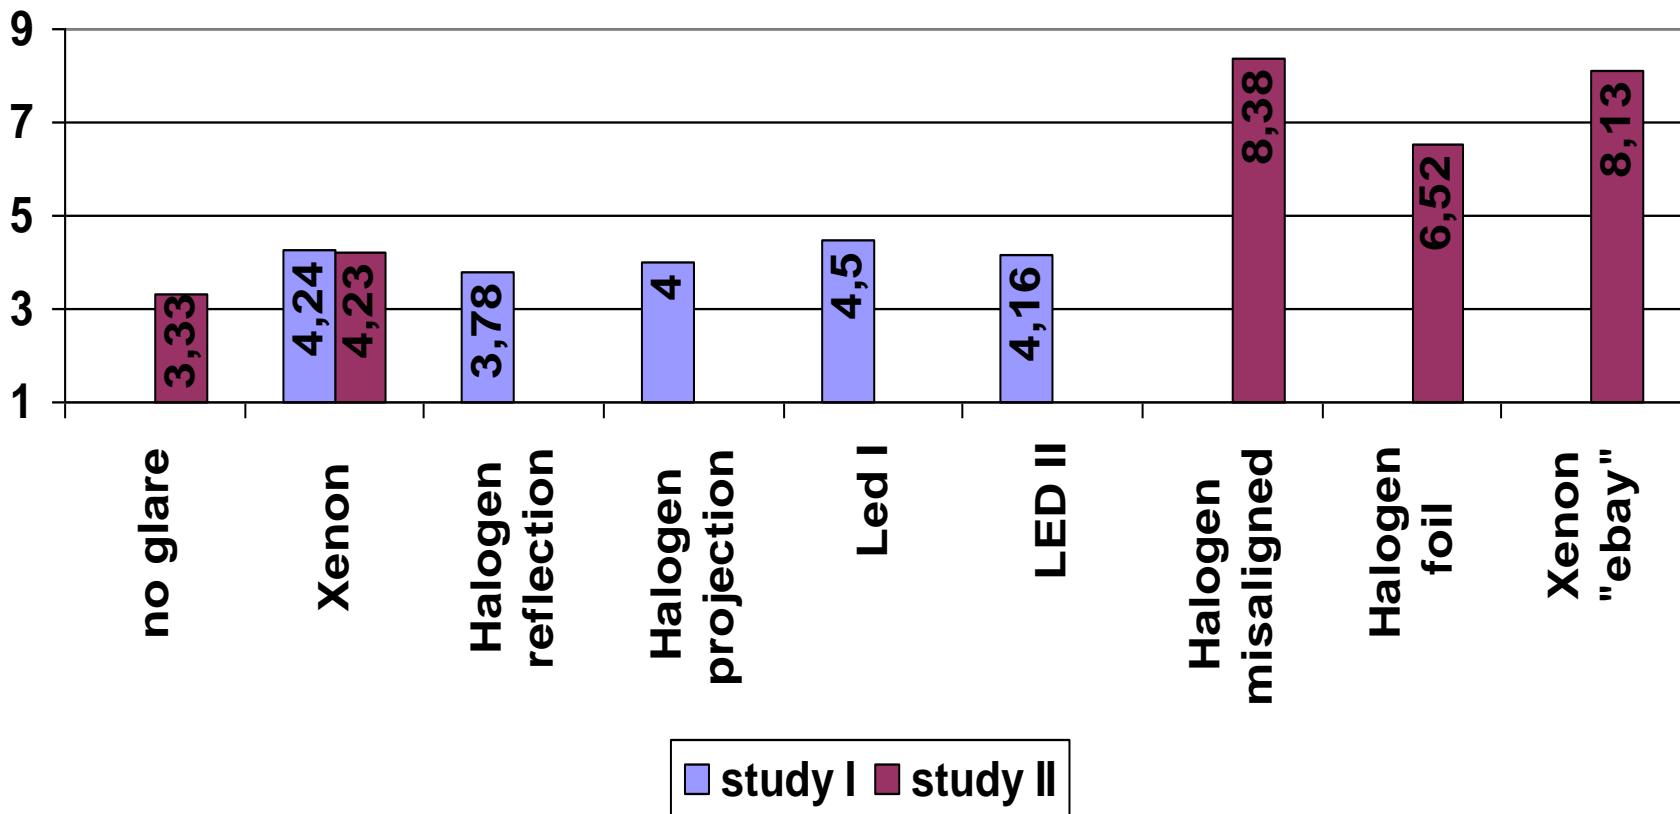

## - Experimental setup

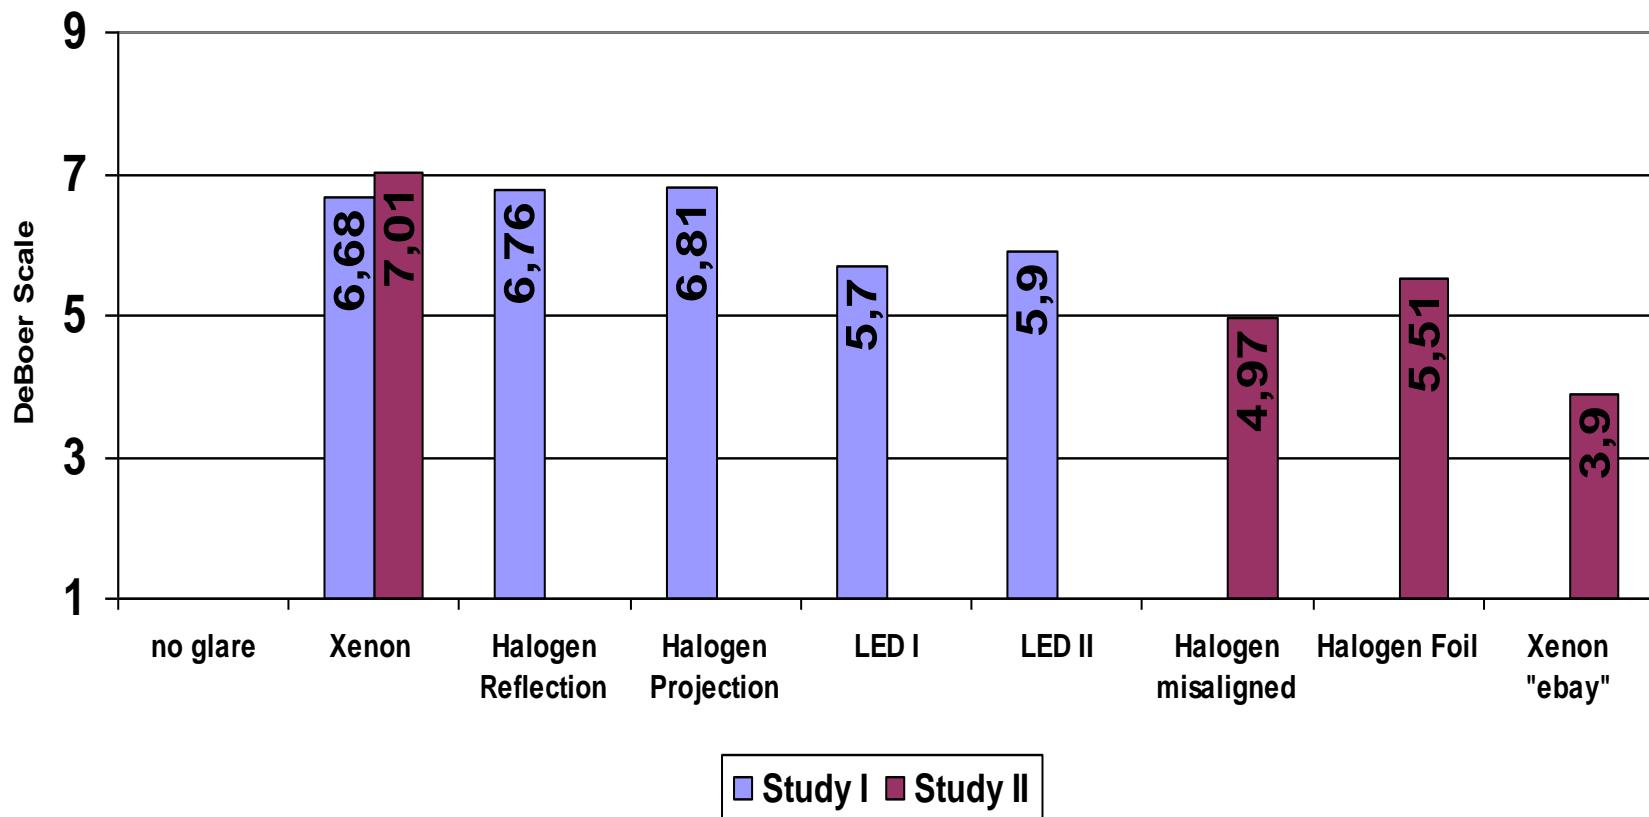

- Xenon projection system
- Halogen projection system
  - misaligned, 1.5 lux
- Halogen reflection system
  - blue foil, 1,82 lux
- Halogen reflection system
  - Xenon upgrade „ebay“, 1.58 lux
- no glare source, 0,22 lux

N = 34

### Results: disability glare

### Results: discomfort glare

- No differences in disability glare if headlamps are correctly adjusted
- No „danger“ in case of Xenon lamps or projection systems
- Visual performance decreases dramatically if the legal requirements are not fulfilled

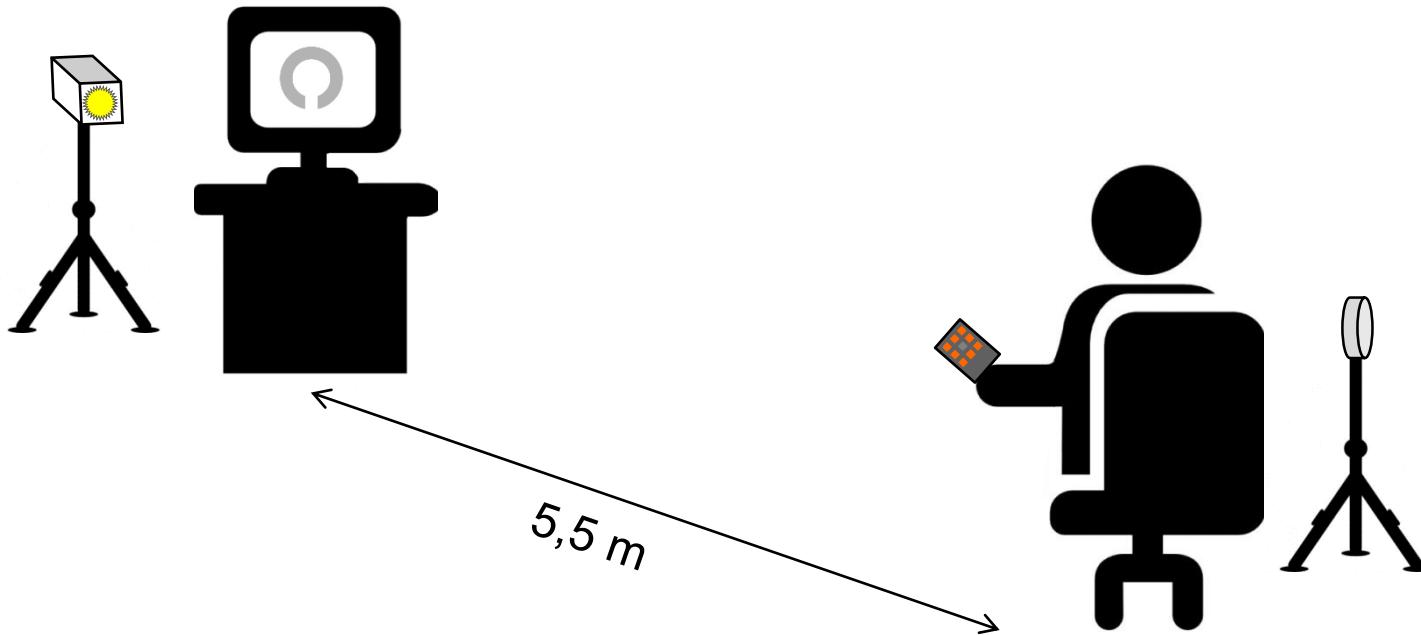

### Problem:

- How to make sure, that headlamps comply with the standards?

Studies in the light tunnel  
**Laboratory studies**  
Influence of glance behavior  
Intended study

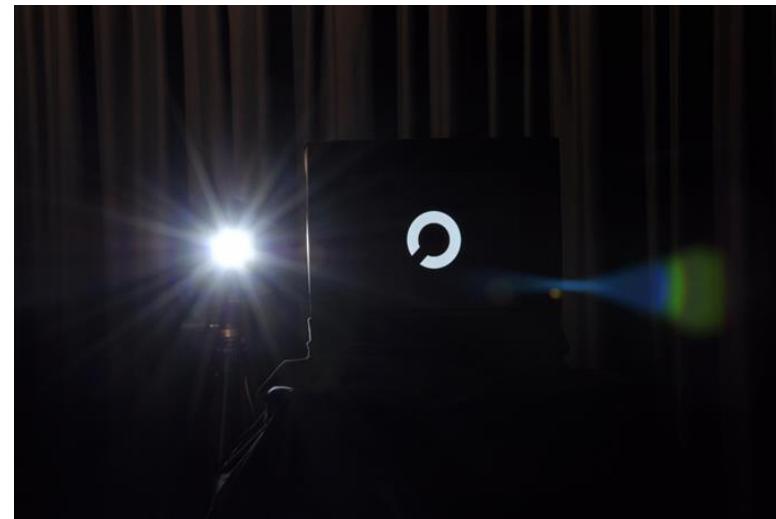

Why an additional Lab-Study?

- Systematic variation of luminance and illuminance as independent variables
- Control over all important confounding variables

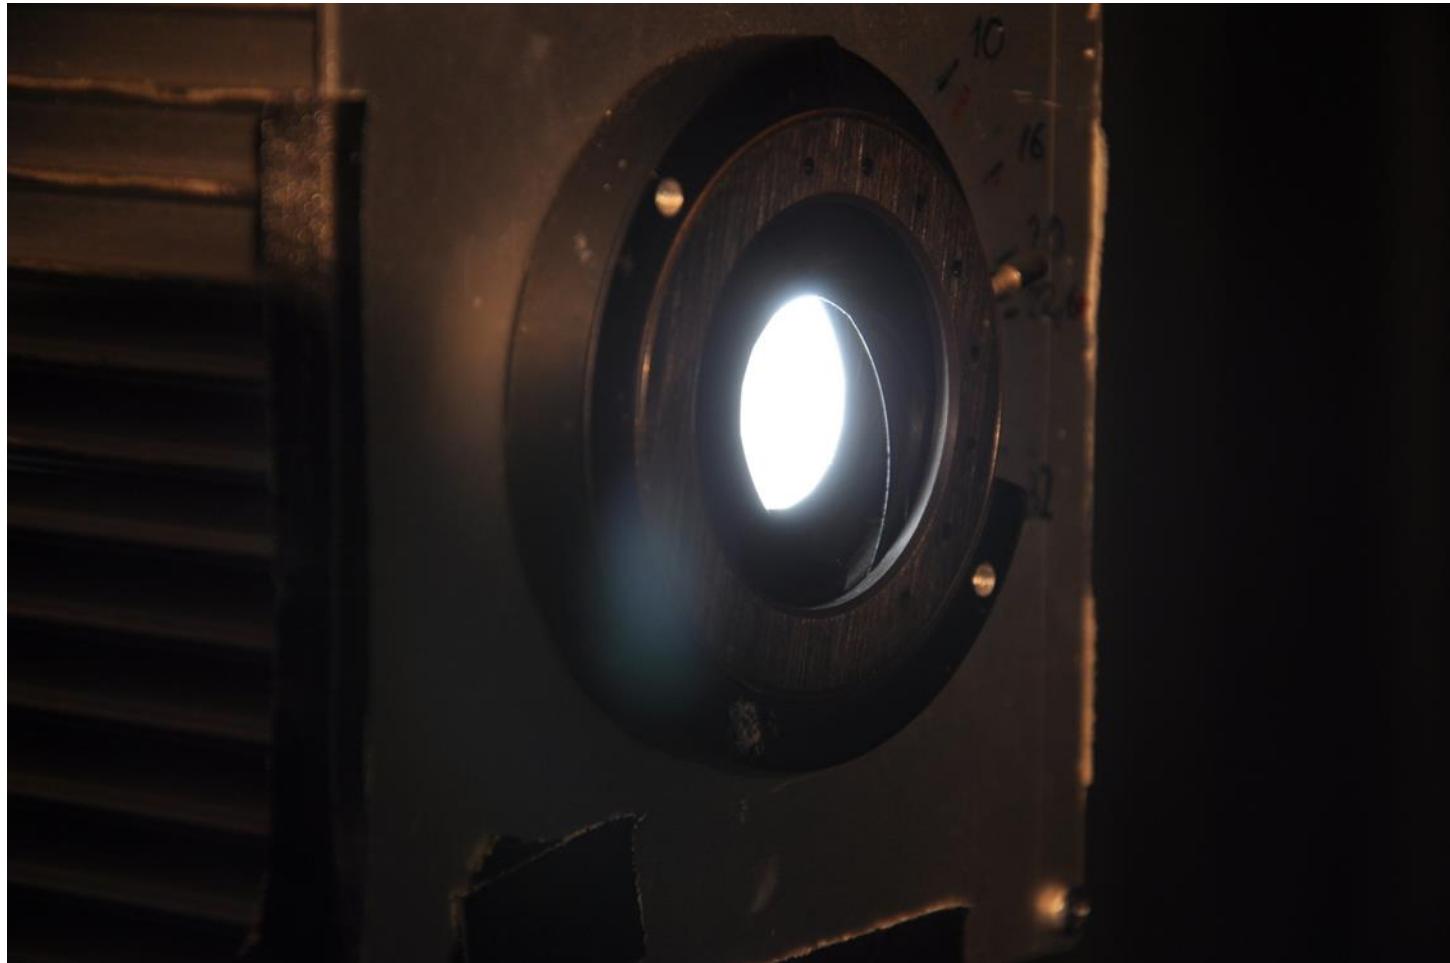

# Laboratory Studies

## - Setup

# Laboratory Studies

## - Setup

### Experiment 1

*Independant variable:*

Luminance

50,000 cd/m<sup>2</sup>  
100,000 cd/m<sup>2</sup>  
250,000 cd/m<sup>2</sup>

### Experiment 2

Illuminance

0.4 lx  
0.8 lx  
1.6 lx

*Dependant variables:*

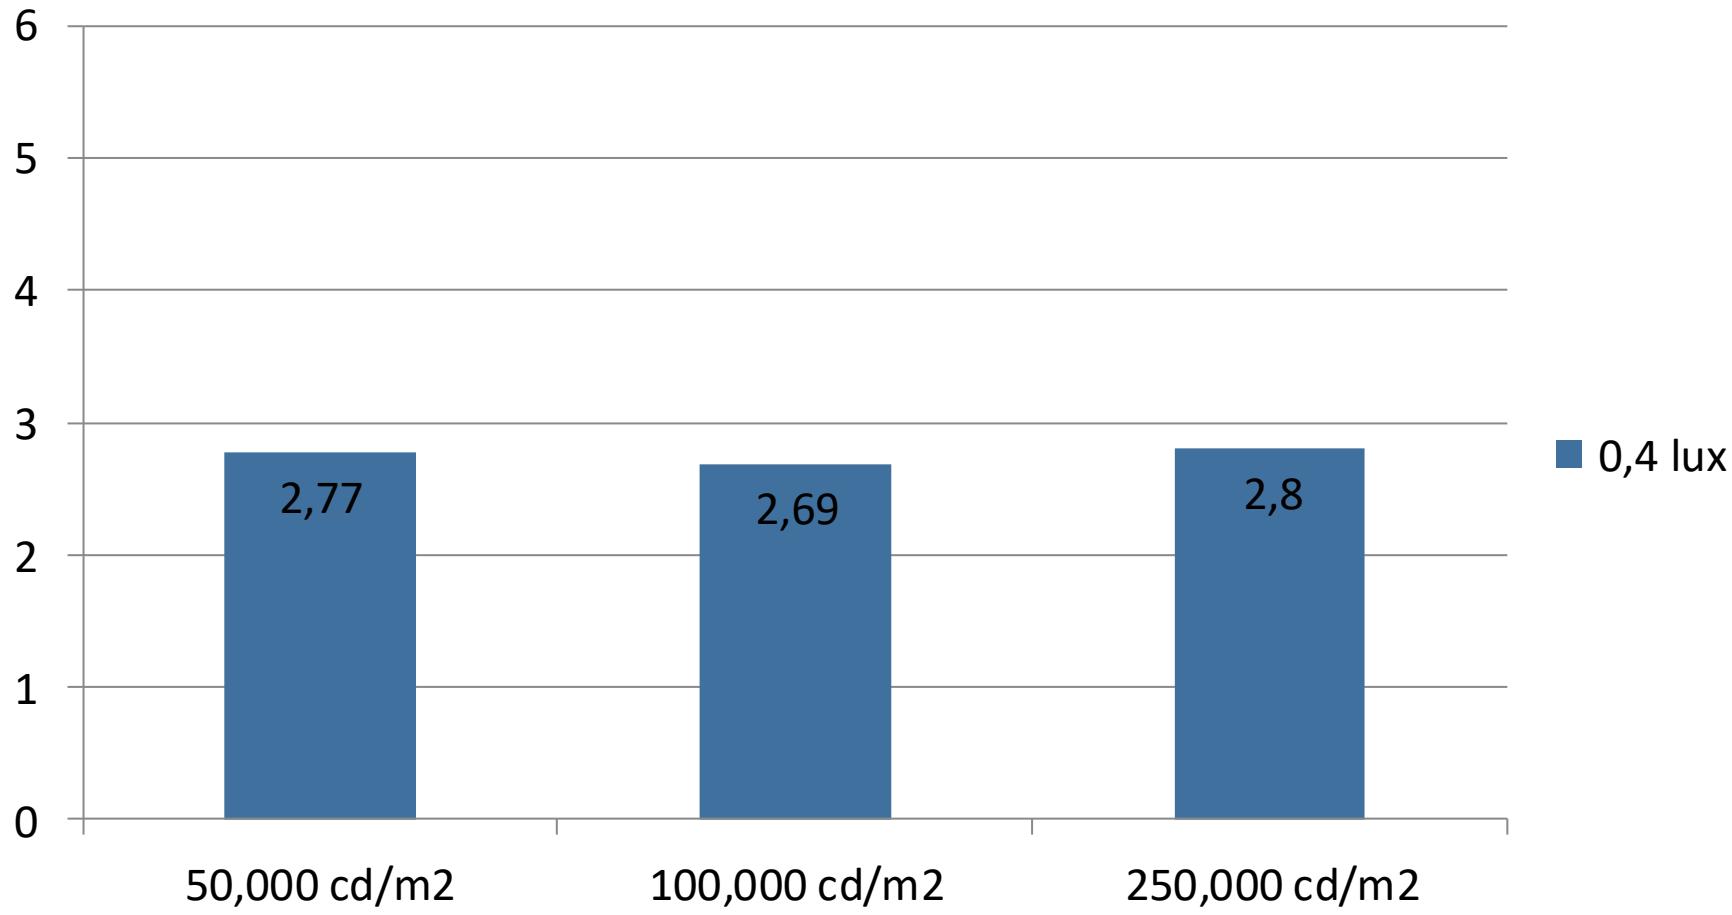

Discomfort glare (DeBoer-Scale)  
Disability glare (Weber contrasts)

*Basic condition:*

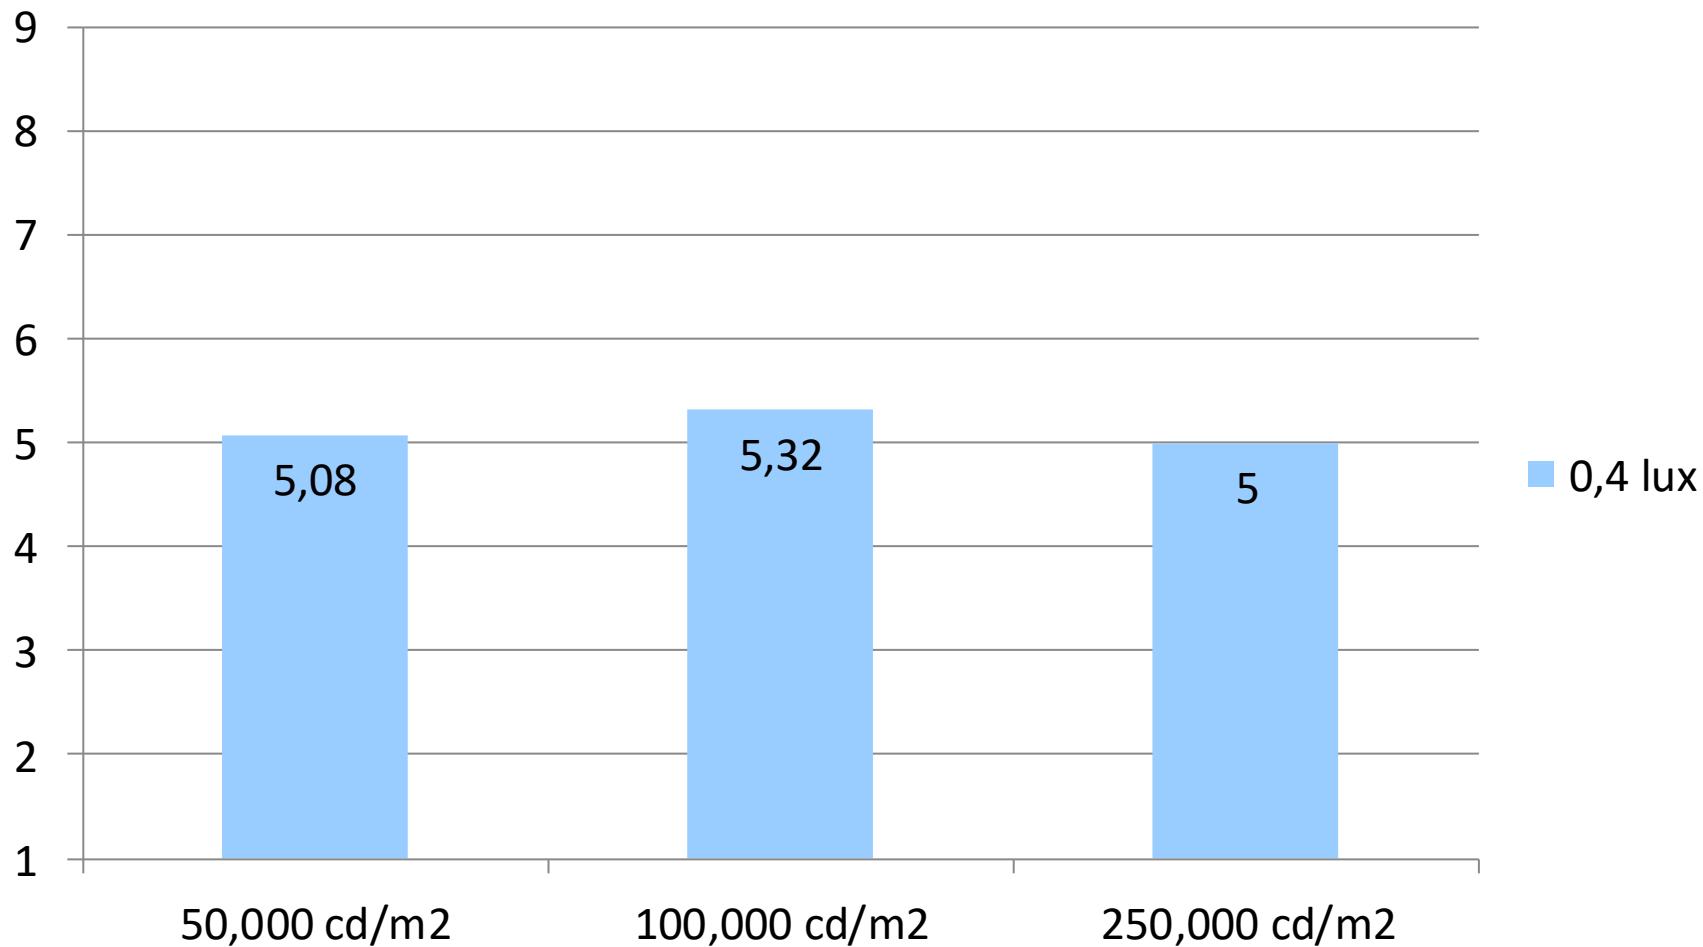

0.4 lx; N = 60

100,000 cd/m<sup>2</sup>; N = 60

### Disability glare (Weber contrasts)

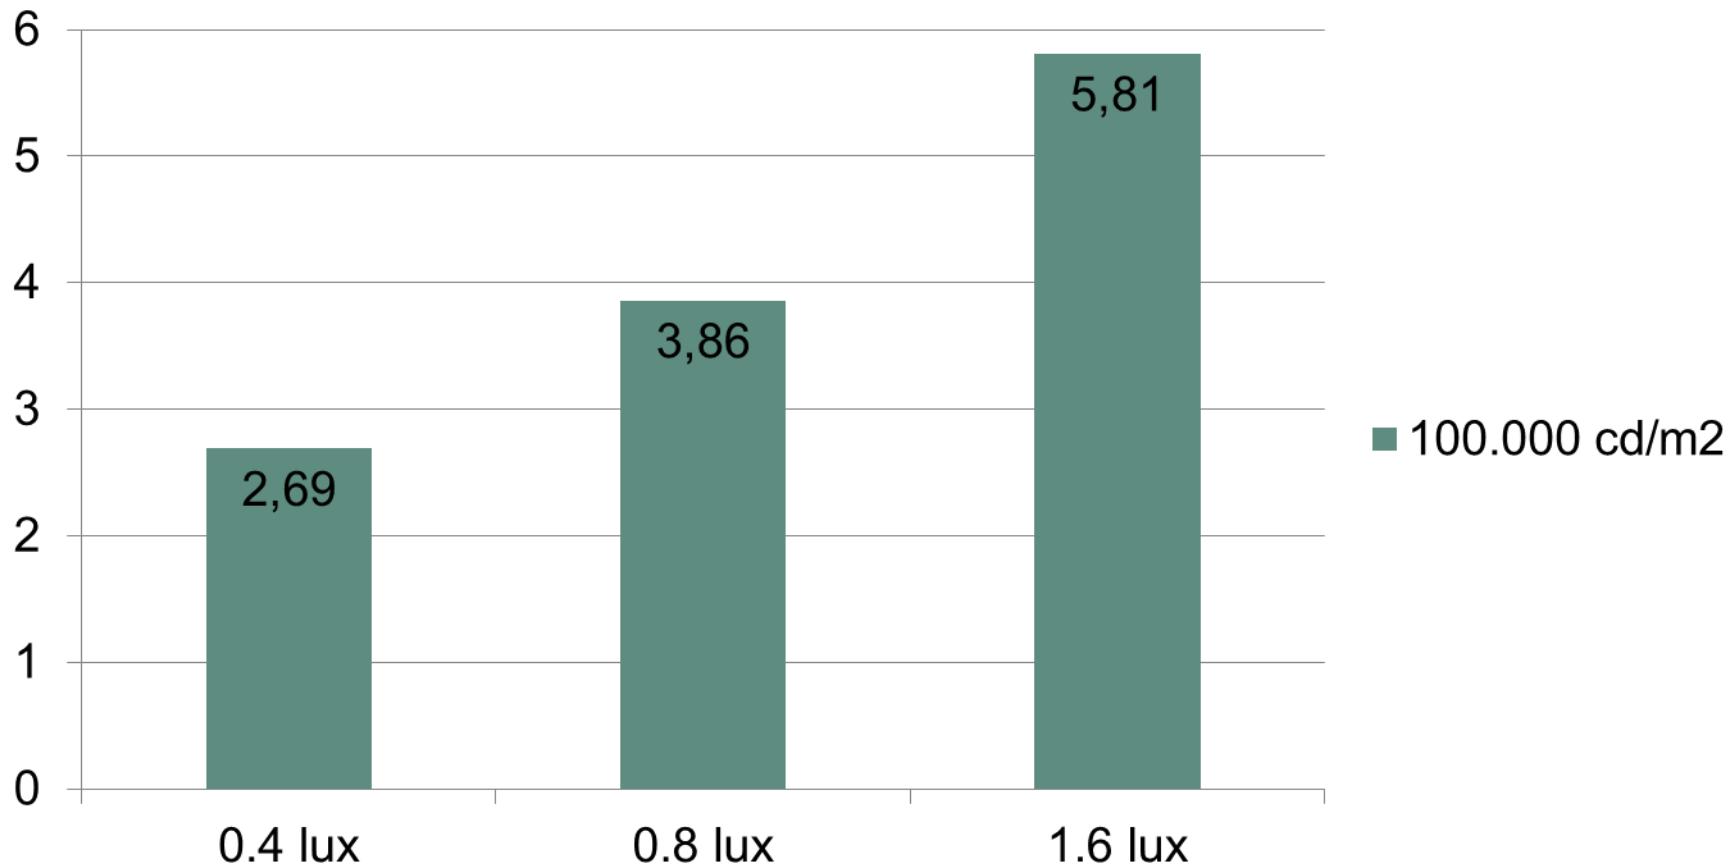

### Discomfort glare (DeBoer – Scale)

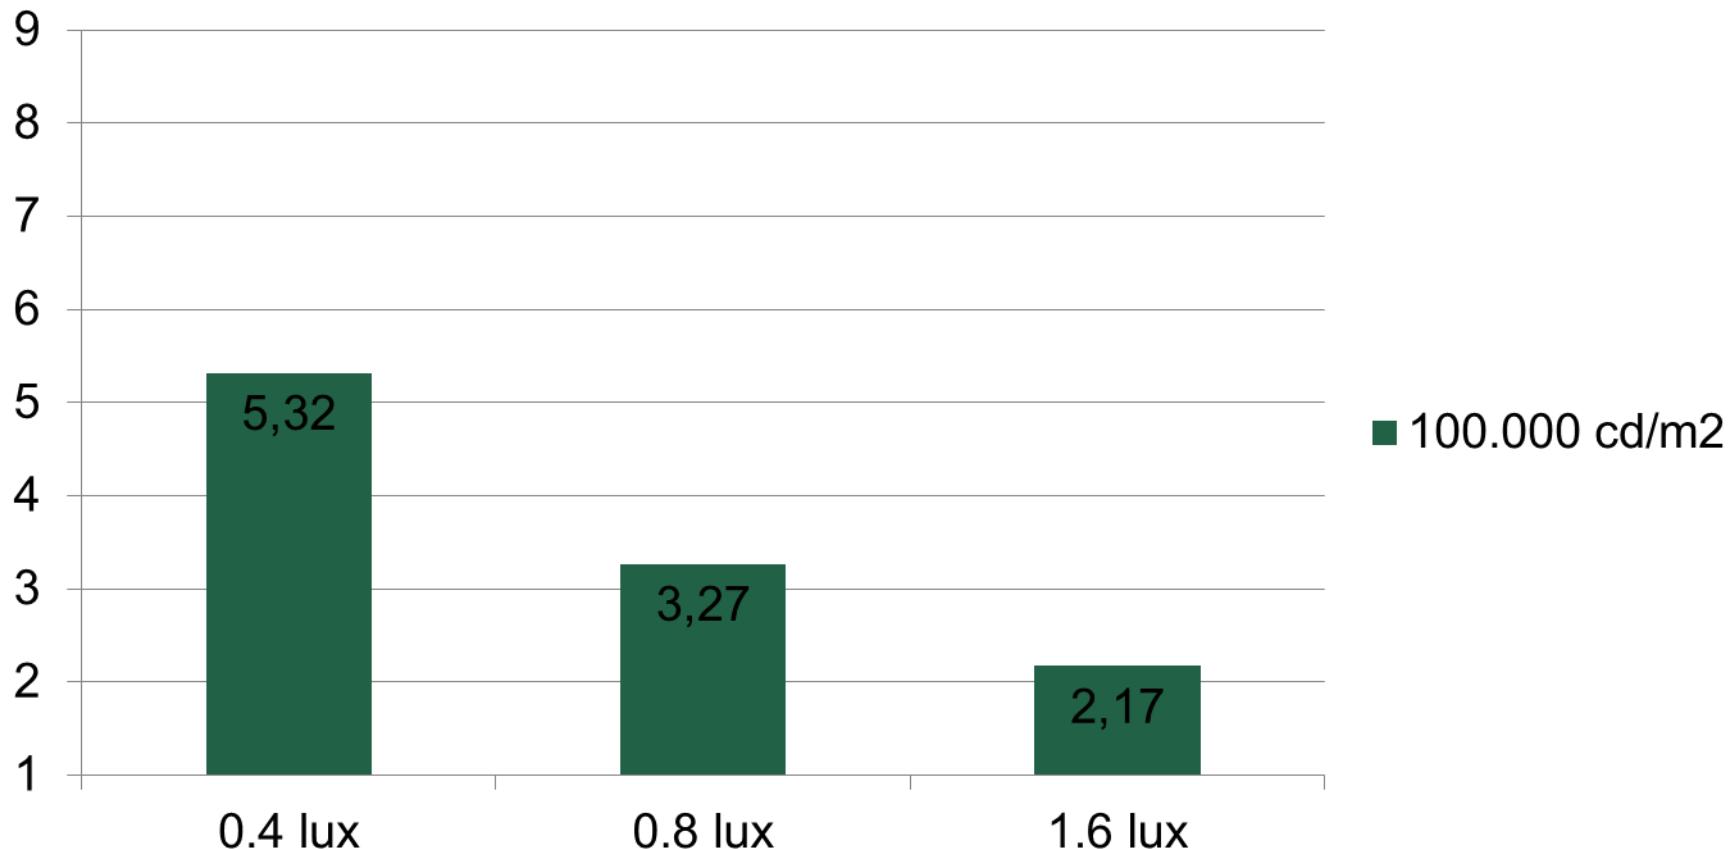

### Disability glare (Weber contrasts)

p < 0.05

### Discomfort glare (DeBoer- Scale)

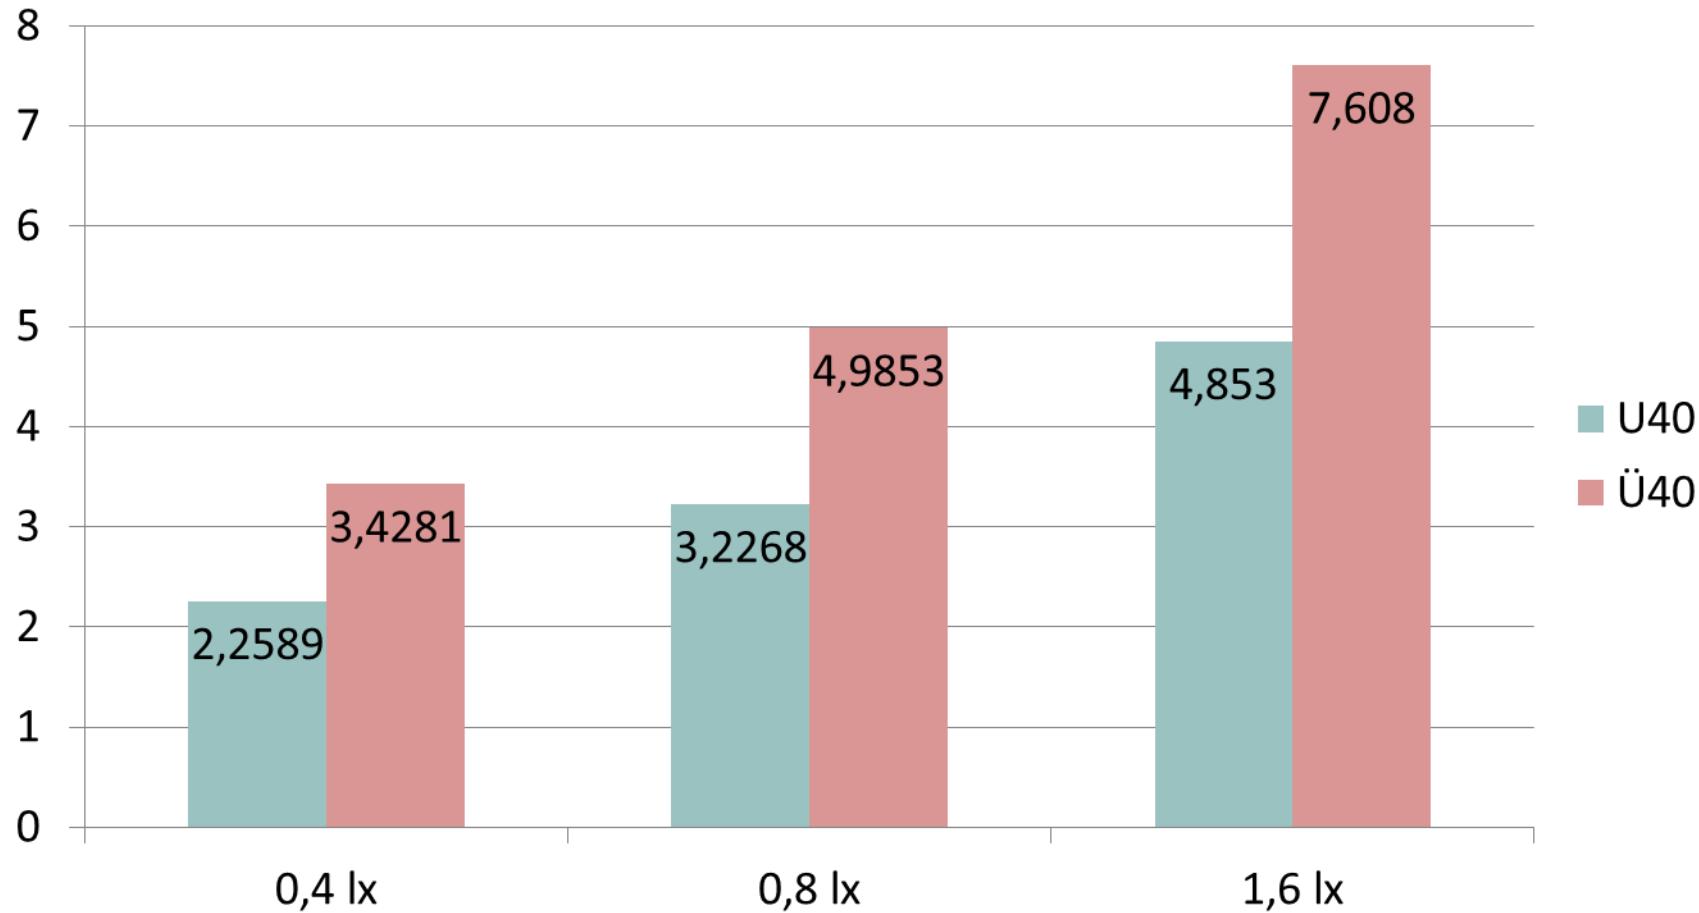

$p < 0.05$

### Disability glare

Weber contrasts

**100.000 cd/m<sup>2</sup>**

- Currently no clues to negative effects caused by high luminance.  
Boundary values: B50L, 50 – 250 kcd/m<sup>2</sup>.
  - Clear effect of the illuminance at the subject's eye.
- Urgent need to meet the legal requirements!

Laboratory studies  
**Influence of glance behavior**  
Intended study

# Influence of Glance Behavior

## - Problem

- Explorative Analysis of eye-tracking videos
- Drivers often look directly into the headlamps of oncoming cars

↳ Glance into the glare source has to be considered!

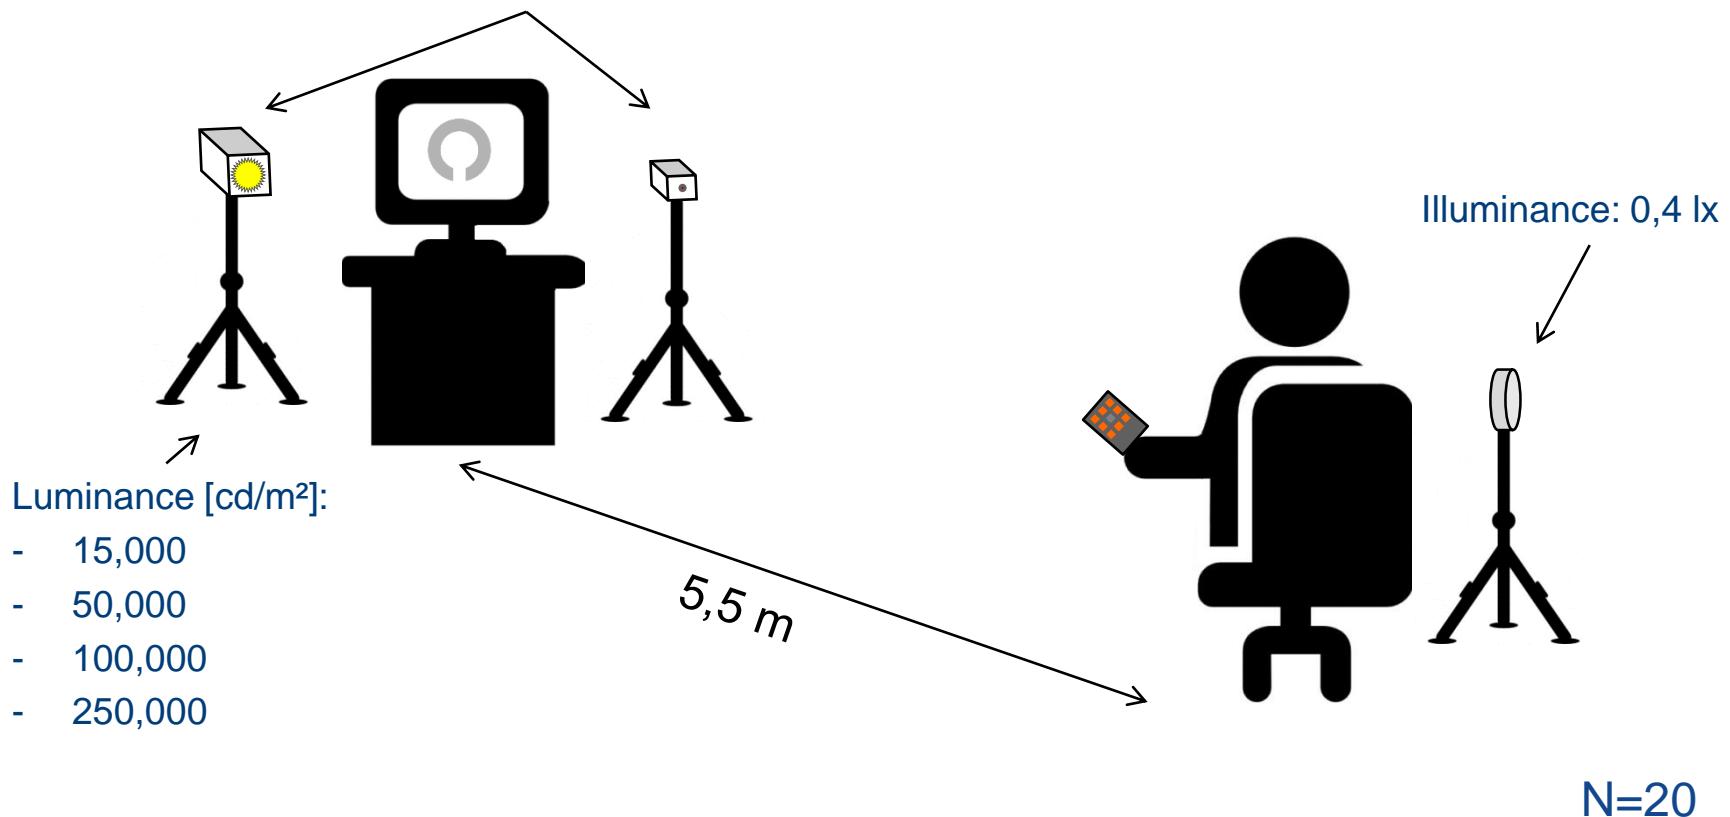

1. What is the influence of looking directly into the glare source or aside on disability and discomfort glare (luminance and illuminance constant)?
  
2. What is the influence of different luminances on disability and discomfort glare (looking directly into the glare source, illuminance constant)?

# Influence of Glance Behavior

## - Setup

Look into the glare source: yes vs. no

- Disability glare: Landolt rings (threshold contrast)
- Discomfort glare: DeBoer – Scale

# Influence of Glance Behavior

## - Setup

# Influence of Glance Behavior

## - Results Discomfort Glare

- Illuminance: 0,4 lx

- Descriptive statistics

Luminance	Look into glare source	Mean	SD
15000 cd/m <sup>2</sup>	Yes	4,38	1,67
50000 cd/m <sup>2</sup>	Yes	4,79	1,72
100000 cd/m <sup>2</sup>	Yes	4,64	1,78
250000 cd/m <sup>2</sup>	Yes	4,54	1,48
100000 cd/m <sup>2</sup>	No	3,26	1,80

Small light emitting areas don't cause more glare

- Direct glance into the glare source increases disability glare, not necessarily discomfort glare
- No influence of luminance was found if test persons were looking directly into the glare source
- Looking directly into the glare source causes an „offset“ in disability glare compared to looking aside. But the „structure“ related to influence of luminance seems to be identical.

Studies in the light tunnel  
Laboratory studies  
Influence of glance behavior  
**Intended study**

Quelle: Audi

In the studies shown above a certain range of luminances has been covered.  
New headlamp prototypes with extrem small light emitting areas are available.  
Are the results valid for the new headlamps?  
→ Replication of the light tunnel study I in summer 2019.
