

Input from Netherlands: Query e-call devices relating to R.10 (EMC)

Recently a couple of questions concerning e-call devices, in relation to R.10 came up. These question were:

- Will it be possible to get a Technical Interpretation regarding e-Call devices and what modes they need to be tested to as part of Regulation 10.05 Certification?
- Have there been any discussions resulting in technical guidance at international level with other Approval Authorities and Technical Services in terms of how to test / operating modes for e-Call devices when certifying to Regulation 10.05 (our understanding is that the e-Call function is planned to be explicitly included in revision 06 of Regulation 10)?
- Is the e-Call function defined as 'Immunity Related' with reference to Regulation 10.05?

Background...

Typical operating modes for e-Call devices are :

- *Idle*
- *Making a Manually Enabled Call (voice and data)*
- *Making an Automatically Enabled Call (voice and data)*

Could the GRE TF EMC perhaps provide some assistance/information on these questions concerning R.10 (EMC)?
